

Value line, 16-MHz STM8S 8-bit MCU, 8-Kbyte Flash memory, 128-byte data EEPROM, 10-bit ADC, 3 timers, UART, SPI, I²C

Datasheet - production data

Features

Core

- 16 MHz advanced STM8 core with Harvard architecture and 3-stage pipeline
- Extended instruction set

Memories

- Program memory: 8 Kbyte Flash memory; data retention 20 years at 55 °C after 100 cycles
- RAM: 1 Kbyte
- Data memory: 128 bytes true data EEPROM; endurance up to 100 k write/erase cycles

Clock, reset and supply management

- 2.95 V to 5.5 V operating voltage
- Flexible clock control, 4 master clock sources
 - Low-power crystal resonator oscillator
 - External clock input
 - Internal, user-trimmable 16 MHz RC
 - Internal low-power 128 kHz RC
- Clock security system with clock monitor
- Power management
 - Low-power modes (wait, active-halt, halt)
 - Switch-off peripheral clocks individually
 - Permanently active, low-consumption power-on and power-down reset

Interrupt management

- Nested interrupt controller with 32 interrupts
- Up to 27 external interrupts on 6 vectors

Timers

- Advanced control timer: 16-bit, 4 CAPCOM channels, 3 complementary outputs, dead-time insertion and flexible synchronization
- 16-bit general purpose timer, with 3 CAPCOM channels (IC, OC or PWM)
- 8-bit basic timer with 8-bit prescaler
- Auto wakeup timer
- Window and independent watchdog timers

Communications interfaces

- UART with clock output for synchronous operation, SmartCard, IrDA, LIN master mode
- SPI interface up to 8 Mbit/s
- I²C interface up to 400 Kbit/s

Analog to digital converter (ADC)

- 10-bit ADC, ± 1 LSB ADC with up to 5 multiplexed channels, scan mode and analog watchdog

I/Os

- Up to 28 I/Os on a 32-pin package including 21 high-sink outputs
- Highly robust I/O design, immune against current injection

Development support

- Embedded single-wire interface module (SWIM) for fast on-chip programming and non-intrusive debugging

1 Introduction

This datasheet contains the description of the STM8S003F3/K3 value line features, pinout, electrical characteristics, mechanical data and ordering information.

- For complete information on the STM8S microcontroller memory, registers and peripherals, please refer to the STM8S and STM8A microcontroller families reference manual (RM0016).
- For information on programming, erasing and protection of the internal Flash memory please refer to the PM0051 (How to program STM8S and STM8A Flash program memory and data EEPROM).
- For information on the debug and SWIM (single wire interface module) refer to the STM8 SWIM communication protocol and debug module user manual (UM0470).
- For information on the STM8 core, please refer to the STM8 CPU programming manual (PM0044).

2 Description

The STM8S003F3/K3 value line 8-bit microcontrollers offer 8 Kbytes of Flash program memory, plus integrated true data EEPROM. They are referred to as low-density devices in the STM8S microcontroller family reference manual (RM0016).

The STM8S003F3/K3 value line devices provide the following benefits: performance, robustness and reduced system cost.

Device performance and robustness are ensured by true data EEPROM supporting up to 100000 write/erase cycles, advanced core and peripherals made in a state-of-the-art technology at 16 MHz clock frequency, robust I/Os, independent watchdogs with separate clock source, and a clock security system.

The system cost is reduced thanks to a high system integration level with internal clock oscillators, watchdog, and brown-out reset.

Full documentation is offered as well as a wide choice of development tools.

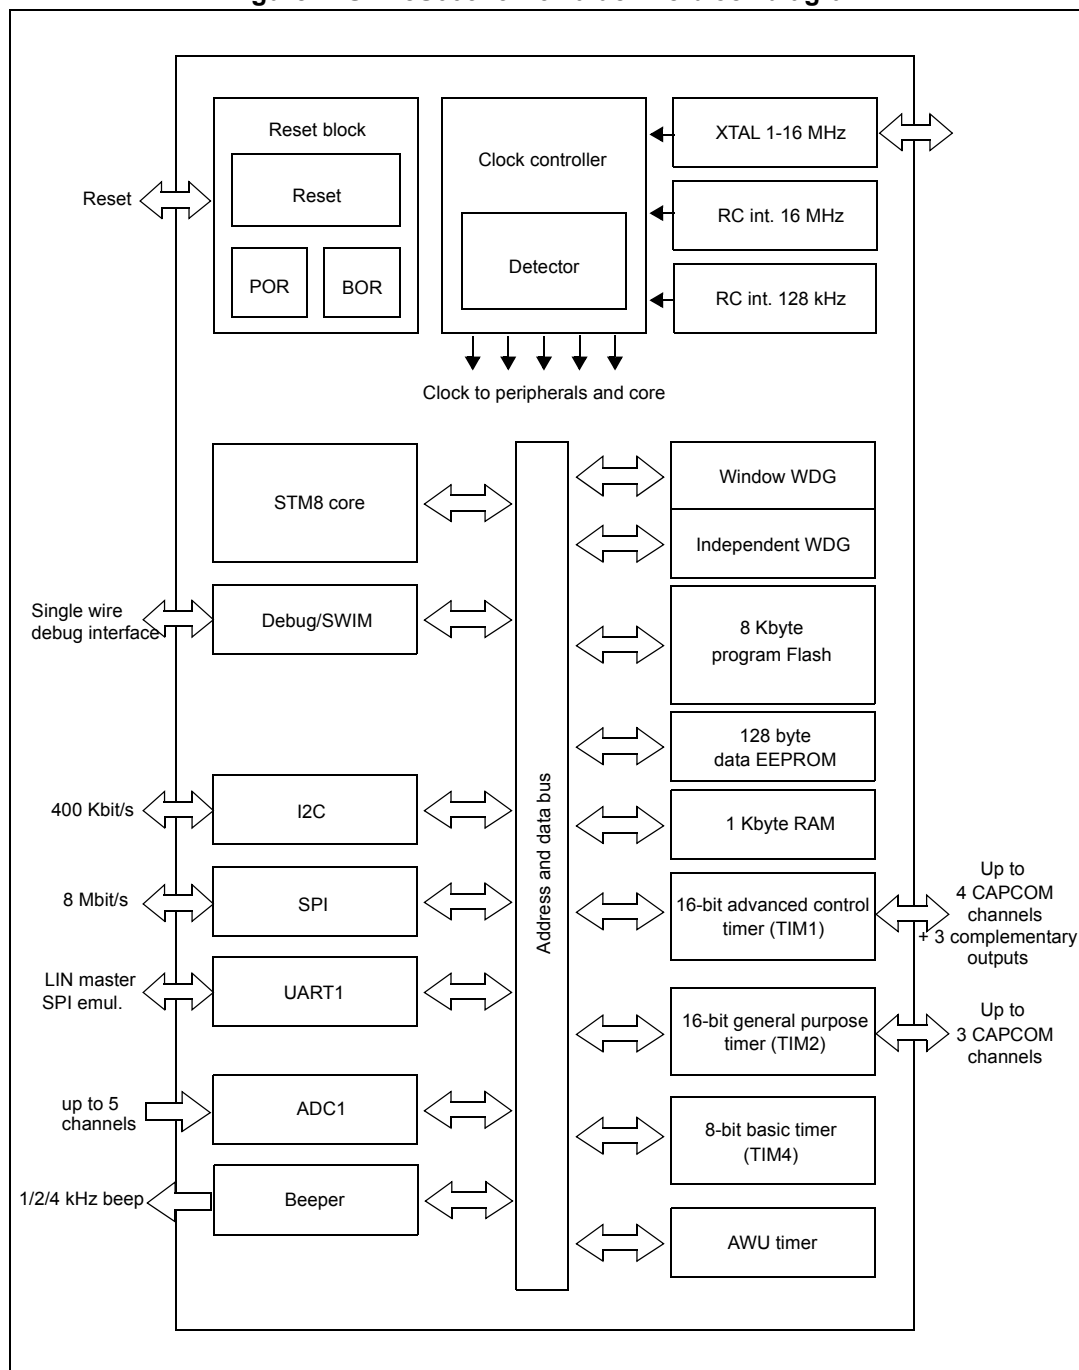

Table 1. STM8S003F3/K3 value line features

Features	STM8S003K3	STM8S003F3
Pin count	32	20
Max. number of GPIOs (I/O)	28	16
External interrupt pins	27	16
Timer CAPCOM channels	7	7
Timer complementary outputs	3	2
A/D converter channels	4	5
High-sink I/Os	21	12
Low-density Flash program memory (byte)	8 K	8 K
RAM (byte)	1 K	1 K
True data EEPROM (byte)	128 ⁽¹⁾	128 ⁽¹⁾
Peripheral set	Multi purpose timer (TIM1), SPI, I2C, UART, Window WDG, independent WDG, ADC, PWM timer (TIM2), 8-bit timer (TIM4)	

1. Without read-while-write capability.

3 Block diagram

Figure 1. STM8S003F3/K3 value line block diagram

4 Product overview

The following section intends to give an overview of the basic features of the STM8S003F3/K3 value line functional modules and peripherals.

For more detailed information please refer to the corresponding family reference manual (RM0016).

4.1 Central processing unit STM8

The 8-bit STM8 core is designed for code efficiency and performance.

It contains six internal registers which are directly addressable in each execution context, 20 addressing modes including indexed indirect and relative addressing and 80 instructions.

Architecture and registers

- Harvard architecture
- 3-stage pipeline
- 32-bit wide program memory bus - single cycle fetching for most instructions
- X and Y 16-bit index registers - enabling indexed addressing modes with or without offset and read-modify-write type data manipulations
- 8-bit accumulator
- 24-bit program counter - 16-Mbyte linear memory space
- 16-bit stack pointer - access to a 64 K-level stack
- 8-bit condition code register - 7 condition flags for the result of the last instruction

Addressing

- 20 addressing modes
- Indexed indirect addressing mode for look-up tables located anywhere in the address space
- Stack pointer relative addressing mode for local variables and parameter passing

Instruction set

- 80 instructions with 2-byte average instruction size
- Standard data movement and logic/arithmetic functions
- 8-bit by 8-bit multiplication
- 16-bit by 8-bit and 16-bit by 16-bit division
- Bit manipulation
- Data transfer between stack and accumulator (push/pop) with direct stack access
- Data transfer using the X and Y registers or direct memory-to-memory transfers

4.2 Single wire interface module (SWIM) and debug module (DM)

The single wire interface module and debug module permits non-intrusive, real-time in-circuit debugging and fast memory programming.

SWIM

Single wire interface module for direct access to the debug module and memory programming. The interface can be activated in all device operation modes. The maximum data transmission speed is 145 byte/ms.

Debug module

The non-intrusive debugging module features a performance close to a full-featured emulator. Beside memory and peripherals, also CPU operation can be monitored in real-time by means of shadow registers.

- R/W to RAM and peripheral registers in real-time
- R/W access to all resources by stalling the CPU
- Breakpoints on all program-memory instructions (software breakpoints)
- Two advanced breakpoints, 23 predefined configurations

4.3 Interrupt controller

- Nested interrupts with three software priority levels
- 32 interrupt vectors with hardware priority
- Up to 27 external interrupts on six vectors including TLI
- Trap and reset interrupts

4.4 Flash program memory and data EEPROM

- 8 Kbyte of Flash program single voltage Flash memory
- 128 byte true data EEPROM
- User option byte area

Write protection (WP)

Write protection of Flash program memory and data EEPROM is provided to avoid unintentional overwriting of memory that could result from a user software malfunction.

There are two levels of write protection. The first level is known as MASS (memory access security system). MASS is always enabled and protects the main Flash program memory, data EEPROM and option bytes.

To perform in-application programming (IAP), this write protection can be removed by writing a MASS key sequence in a control register. This allows the application to modify the content of main program memory and data EEPROM, or to reprogram the device option bytes.

A second level of write protection, can be enabled to further protect a specific area of memory known as UBC (user boot code). Refer to [Figure 2](#).

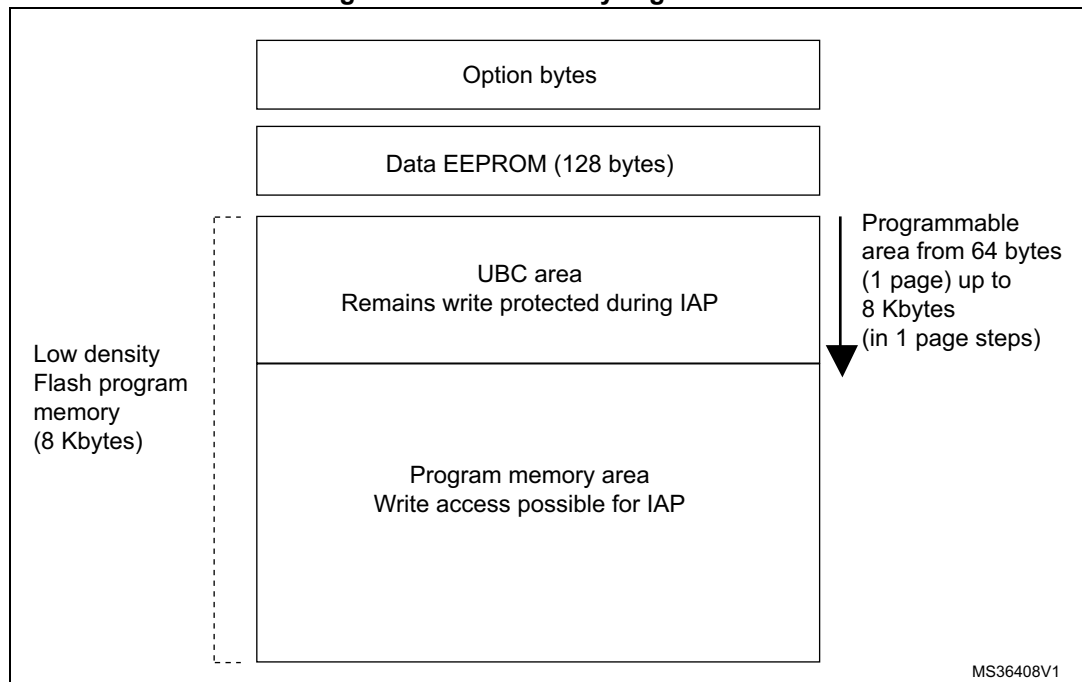

The size of the UBC is programmable through the UBC option byte (*Table 13*), in increments of 1 page (64-byte block) by programming the UBC option byte in ICP mode.

This divides the program memory into two areas:

- Main program memory: 8 Kbyte minus UBC
- User-specific boot code (UBC): Configurable up to 8 Kbyte

The UBC area remains write-protected during in-application programming. This means that the MASS keys do not unlock the UBC area. It protects the memory used to store the boot program, specific code libraries, reset and interrupt vectors, the reset routine and usually the IAP and communication routines.

Figure 2. Flash memory organization

Read-out protection (ROP)

The read-out protection blocks reading and writing from/to the Flash program memory and data EEPROM memory in ICP mode (and debug mode). Once the read-out protection is activated, any attempt to toggle its status triggers a global erase of the program memory. Even if no protection can be considered as totally unbreakable, the feature provides a very high level of protection for a general purpose microcontroller.

4.5 Clock controller

The clock controller distributes the system clock (f_{MASTER}) coming from different oscillators to the core and the peripherals. It also manages clock gating for low power modes and ensures clock robustness.

Features

- **Clock prescaler:** To get the best compromise between speed and current consumption the clock frequency to the CPU and peripherals can be adjusted by a programmable prescaler.
- **Safe clock switching:** Clock sources can be changed safely on the fly in run mode through a configuration register. The clock signal is not switched until the new clock source is ready. The design guarantees glitch-free switching.
- **Clock management:** To reduce power consumption, the clock controller can stop the clock to the core, individual peripherals or memory.
- **Master clock sources:** Four different clock sources can be used to drive the master clock:
 - 1-16 MHz high-speed external crystal (HSE)
 - Up to 16 MHz high-speed user-external clock (HSE user-ext)
 - 16 MHz high-speed internal RC oscillator (HSI)
 - 128 kHz low-speed internal RC (LSI)
- **Startup clock:** After reset, the microcontroller restarts by default with an internal 2 MHz clock (HSI/8). The prescaler ratio and clock source can be changed by the application program as soon as the code execution starts.
- **Clock security system (CSS):** This feature can be enabled by software. If an HSE clock failure occurs, the internal RC (16 MHz/8) is automatically selected by the CSS and an interrupt can optionally be generated.
- **Configurable main clock output (CCO):** This outputs an external clock for use by the application.

Table 2. Peripheral clock gating bit assignments in CLK_PCKENR1/2 registers

Bit	Peripheral clock	Bit	Peripheral clock	Bit	Peripheral clock	Bit	Peripheral clock
PCKEN17	TIM1	PCKEN13	UART1	PCKEN27	Reserved	PCKEN23	ADC
PCKEN16	Reserved	PCKEN12	Reserved	PCKEN26	Reserved	PCKEN22	AWU
PCKEN15	TIM2	PCKEN11	SPI	PCKEN25	Reserved	PCKEN21	Reserved
PCKEN14	TIM4	PCKEN10	I ² C	PCKEN24	Reserved	PCKEN20	Reserved

4.6 Power management

For efficient power management, the application can be put in one of four different low-power modes. You can configure each mode to obtain the best compromise between the lowest power consumption, the fastest start-up time and available wakeup sources.

- **Wait mode:** In this mode, the CPU is stopped, but peripherals are kept running. The wakeup is performed by an internal or external interrupt or reset.
- **Active halt mode with regulator on:** In this mode, the CPU and peripheral clocks are stopped. An internal wakeup is generated at programmable intervals by the auto wake up unit (AWU). The main voltage regulator is kept powered on, so current consumption is higher than in active halt mode with regulator off, but the wakeup time is faster. Wakeup is triggered by the internal AWU interrupt, external interrupt or reset.
- **Active halt mode with regulator off:** This mode is the same as active halt with regulator on, except that the main voltage regulator is powered off, so the wake up time is slower.
- **Halt mode:** In this mode the microcontroller uses the least power. The CPU and peripheral clocks are stopped, the main voltage regulator is powered off. Wakeup is triggered by external event or reset.

4.7 Watchdog timers

The watchdog system is based on two independent timers providing maximum security to the applications.

Activation of the watchdog timers is controlled by option bytes or by software. Once activated, the watchdogs cannot be disabled by the user program without performing a reset.

Window watchdog timer

The window watchdog is used to detect the occurrence of a software fault, usually generated by external interferences or by unexpected logical conditions, which cause the application program to abandon its normal sequence.

The window function can be used to trim the watchdog behavior to match the application perfectly.

The application software must refresh the counter before time-out and during a limited time window.

A reset is generated in two situations:

1. Timeout: at 16 MHz CPU clock the time-out period can be adjusted between 75 μ s up to 64 ms.
2. Refresh out of window: the down-counter is refreshed before its value is lower than the one stored in the window register.

Independent watchdog timer

The independent watchdog peripheral can be used to resolve processor malfunctions due to hardware or software failures.

It is clocked by the 128 kHz LSI internal RC clock source, and thus stays active even in case of a CPU clock failure

The IWDG time base spans from 60 μ s to 1 s.

4.8 Auto wakeup counter

- Used for auto wakeup from active halt mode
- Clock source: internal 128 kHz internal low frequency RC oscillator or external clock
- LSI clock can be internally connected to TIM1 input capture channel 1 for calibration

4.9 Beeper

The beeper function outputs a signal on the BEEP pin for sound generation. The signal is in the range of 1, 2 or 4 kHz.

The beeper output port is only available through the alternate function remap option bit AFR7.

4.10 TIM1 - 16-bit advanced control timer

This is a high-end timer designed for a wide range of control applications. With its complementary outputs, dead-time control and center-aligned PWM capability, the field of applications is extended to motor control, lighting and half-bridge driver.

- 16-bit up, down and up/down autoreload counter with 16-bit prescaler
- Four independent capture/compare channels (CAPCOM) configurable as input capture, output compare, PWM generation (edge and center aligned mode) and single pulse mode output
- Synchronization module to control the timer with external signals
- Break input to force the timer outputs into a defined state
- Three complementary outputs with adjustable dead time
- Encoder mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update, 1 x break

4.11 TIM2 - 16-bit general purpose timer

- 16-bit autoreload (AR) up-counter
- 15-bit prescaler adjustable to fixed power of 2 ratios 1...32768
- 3 individually configurable capture/compare channels
- PWM mode
- Interrupt sources: 3 x input capture/output compare, 1 x overflow/update

4.12 TIM4 - 8-bit basic timer

- 8-bit autoreload, adjustable prescaler ratio to any power of 2 from 1 to 128
- Clock source: CPU clock
- Interrupt source: 1 x overflow/update

Table 3. TIM timer features

Timer	Counter size (bits)	Prescaler	Counting mode	CAPCOM channels	Complem. outputs	Ext. trigger	Timer synchr-onization/chaining
TIM1	16	Any integer from 1 to 65536	Up/down	4	3	Yes	No
TIM2	16	Any power of 2 from 1 to 32768	Up	3	0	No	
TIM4	8	Any power of 2 from 1 to 128	Up	0	0	No	

4.13 Analog-to-digital converter (ADC1)

STM8S003F3/K3 value line products contain a 10-bit successive approximation A/D converter (ADC1) with up to 5 external multiplexed input channels and the following main features:

- Input voltage range: 0 to V_{DDA}
- Conversion time: 14 clock cycles
- Single and continuous, buffered continuous conversion modes
- Buffer size (10 x 10 bits)
- Scan mode for single and continuous conversion of a sequence of channels
- Analog watchdog capability with programmable upper and lower thresholds
- Analog watchdog interrupt
- External trigger input
- Trigger from TIM1 TRGO
- End of conversion (EOC) interrupt

Note: Additional AIN12 analog input is not selectable in ADC scan mode or with analog watchdog. Values converted from AIN12 are stored only into the ADC_DRH/ADC_DRL registers.

4.14 Communication interfaces

The following communication interfaces are implemented:

- UART1: full feature UART, synchronous mode, SPI master mode, SmartCard mode, IrDA mode, LIN2.1 master capability
- SPI: full and half-duplex, 8 Mbit/s
- I²C: up to 400 Kbit/s

4.14.1 UART1

Main features

- 1 Mbit/s full duplex SCI
- SPI emulation
- High precision baud rate generator
- Smartcard emulation
- IrDA SIR encoder decoder
- LIN master mode
- Single wire half duplex mode

Asynchronous communication (UART mode)

- Full duplex communication - NRZ standard format (mark/space)
- Programmable transmit and receive baud rates up to 1 Mbit/s ($f_{CPU}/16$) and capable of following any standard baud rate regardless of the input frequency
- Separate enable bits for transmitter and receiver
- Two receiver wakeup modes:
 - Address bit (MSB)
 - Idle line (interrupt)
- Transmission error detection with interrupt generation
- Parity control

Synchronous communication

- Full duplex synchronous transfers
- SPI master operation
- 8-bit data communication
- Maximum speed: 1 Mbit/s at 16 MHz ($f_{CPU}/16$)

LIN master mode

- Emission: generates 13-bit synch. break frame
- Reception: detects 11-bit break frame

4.14.2 SPI

- Maximum speed: 8 Mbit/s ($f_{MASTER}/2$) both for master and slave
- Full duplex synchronous transfers
- Simplex synchronous transfers on two lines with a possible bidirectional data line
- Master or slave operation - selectable by hardware or software
- CRC calculation
- 1 byte Tx and Rx buffer
- Slave/master selection input pin

4.14.3 I²C

- I²C master features
 - Clock generation
 - Start and stop generation
- I²C slave features
 - Programmable I²C address detection
 - Stop bit detection
- Generation and detection of 7-bit/10-bit addressing and general call
- Supports different communication speeds
 - Standard speed (up to 100 kHz)
 - Fast speed (up to 400 kHz)

5 Pinouts and pin descriptions

Table 4. Legend/abbreviations for STM8S003F3/K3 pin description tables

Type	I = input, O = output, S = power supply	
Level	Input	CM = CMOS
	Output	HS = high sink
Output speed	O1 = slow (up to 2 MHz) O2 = fast (up to 10 MHz) O3 = fast/slow programmability with slow as default state after reset O4 = fast/slow programmability with fast as default state after reset	
Port and control configuration	Input	float = floating, wpu = weak pull-up
	Output	T = true open drain, OD = open drain, PP = push pull
Reset state	Bold x (pin state after internal reset release) Unless otherwise specified, the pin state is the same during the reset phase and after the internal reset release.	

Table 5. STM8S003K3 descriptions (continued)

LQFP32	Pin name	Type	Input			Output				Main function (after reset)	Default alternate function	Alternate function after remap [option bit]
			floating	wpu	Ext. interrupt	High sink ⁽¹⁾	Speed	OD	PP

32	PD7/TLI [TIM1_CH4]	I/O	X	X	X	HS	O3	X	X	Port D7	Top level interrupt	Timer 1 - channel 4 [AFR6]

1. I/O pins used simultaneously for high-current source/sink must be uniformly spaced around the package. In addition, the total driven current must respect the absolute maximum ratings given in [Section 9: Electrical characteristics](#).
2. When the MCU is in Halt/Active-halt mode, PA1 is automatically configured in input weak pull-up and cannot be used for waking up the device. In this mode, the output state of PA1 is not driven. It is recommended to use PA1 only in input mode if Halt/Active-halt is used in the application.
3. In the open-drain output column, "T" defines a true open-drain I/O (P-buffer, weak pull-up, and protection diode to V_{DD} are not implemented).
4. The PD1 pin is in input pull-up during the reset phase and after the internal reset release.

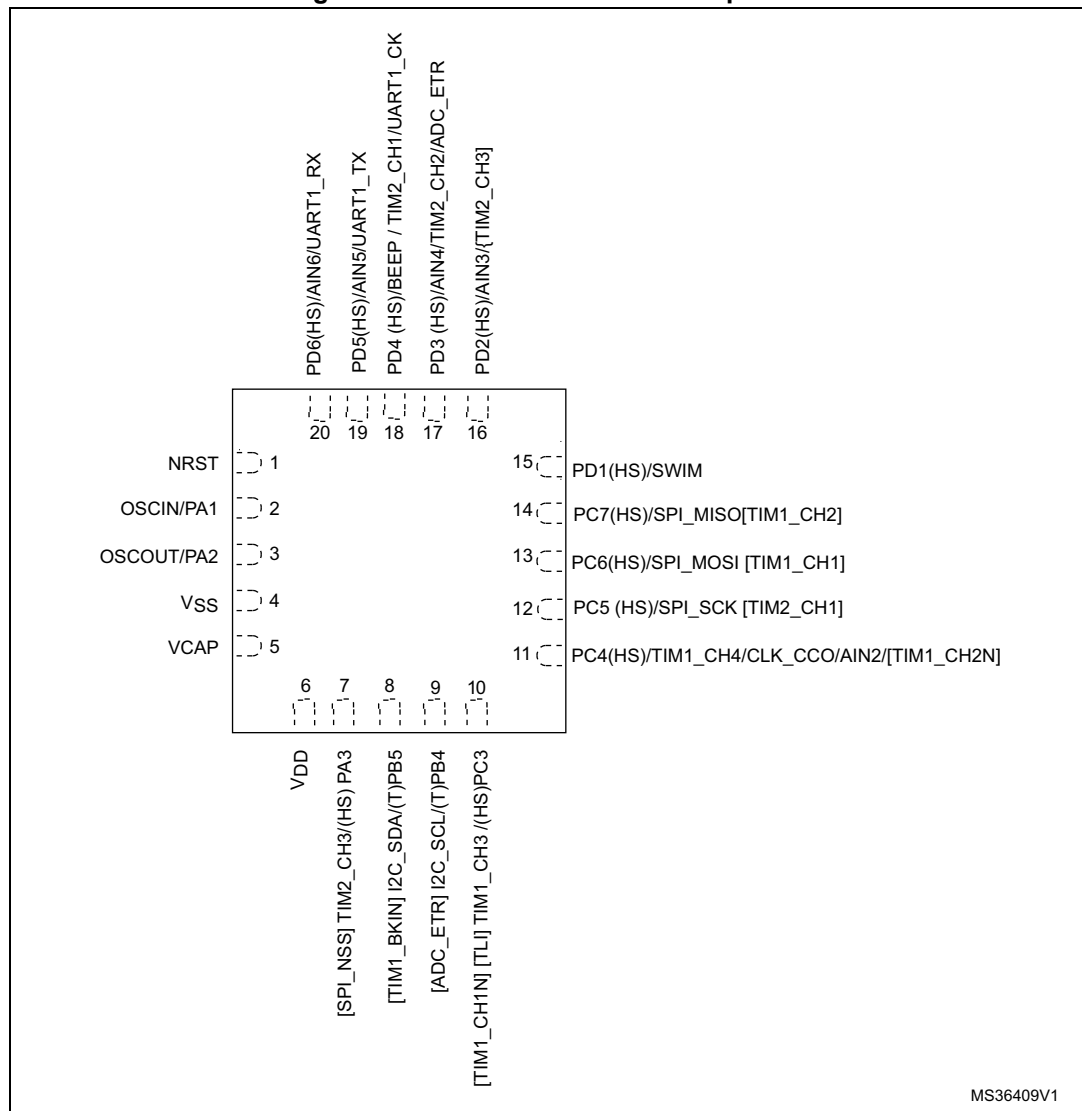

5.2 STM8S003F3 TSSOP20/UFQFPN20 pinout and pin description

Figure 4. STM8S003F3 TSSOP20 pinout

1. HS high sink capability.
2. (T) True open drain (P-buffer and protection diode to VDD not implemented).
3. [] alternate function remapping option (If the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).

Figure 5. STM8S003F3 UFQFPN20 pinout

1. HS high sink capability.
2. (T) True open drain (P-buffer and protection diode to VDD not implemented).
3. [] alternate function remapping option (If the same alternate function is shown twice, it indicates an exclusive choice not a duplication of the function).

19	16	PD2/AIN3/ [TIM2_ CH3]	I/O	X	X	X	HS	O3	X	X	Port D2	Analog input 3	Timer 2 - channel 3 [AFR1]
20	17	PD3/ AIN4/ TIM2_ CH2/ ADC_ ETR	I/O	X	X	X	HS	O3	X	X	Port D3	Analog input 4/ Timer 2 - channel 2/ADC external trigger	-

1. I/O pins used simultaneously for high current source/sink must be uniformly spaced around the package. In addition, the total driven current must respect the absolute maximum ratings.
2. When the MCU is in halt/active-halt mode, PA1 is automatically configured in input weak pull-up and cannot be used for waking up the device. In this mode, the output state of PA1 is not driven. It is recommended to use PA1 only in input mode if halt/active-halt is used in the application.
3. In the open-drain output column, "T" defines a true open-drain I/O (P-buffer, weak pull-up, and protection diode to VDD are not implemented).
4. The PD1 pin is in input pull-up during the reset phase and after internal reset release.

5.3 Alternate function remapping

As shown in the rightmost column of the pin description table, some alternate functions can be remapped at different I/O ports by programming one of eight AFR (alternate function remap) option bits. Refer to [Section 8: Option bytes](#). When the remapping option is active, the default alternate function is no longer available.

To use an alternate function, the corresponding peripheral must be enabled in the peripheral registers.

Alternate function remapping does not effect GPIO capabilities of the I/O ports (see the GPIO section of the family reference manual, RM0016).

[Table 7](#) lists the boundary addresses for each memory size. The top of the stack is at the RAM end address in each case.

Table 7. Flash, Data EEPROM and RAM boundary addresses

Memory area	Size (byte)	Start address	End address
Flash program memory	8 K	0x00 8000	0x00 9FFF
RAM	1 K	0x00 0000	0x00 03FF
Data EEPROM	128	0x00 4000	0x00 407F

6.2 Register map

6.2.1 I/O port hardware register map

Table 8. I/O port hardware register map

Address	Block	Register label	Register name	Reset status
0x00 5000	Port A	PA_ODR	Port A data output latch register	0x00

23	TIM4	TIM4 update/overflow	-	-	0x00 8064
24	Flash	EOP/WR_PG_DIS	-	-	0x00 8068
Reserved					0x00 806C to 0x00 807C

1. Except PA1

8 Option bytes

Option bytes contain configurations for device hardware features as well as the memory protection of the device. They are stored in a dedicated block of the memory. Except for the ROP (read-out protection) byte, each option byte has to be stored twice, in a regular form (OPTx) and a complemented one (NOPTx) for redundancy.

Option bytes can be modified in ICP mode (via SWIM) by accessing the EEPROM address shown in [Table 12: Option bytes](#) below. Option bytes can also be modified 'on the fly' by the application in IAP mode, except the ROP option that can only be modified in ICP mode (via SWIM).

Refer to the STM8S Flash programming manual (PM0051) and STM8 SWIM communication protocol and debug module user manual (UM0470) for information on SWIM programming procedures.

Table 12. Option bytes

Addr.	Option name	Option byte no.	Option bits								Factory default setting
			7	6	5	4	3	2	1	0	
0x4800	Read-out protection (ROP)	OPT0	ROP[7:0]								0x00
0x4801	User boot code (UBC)	OPT1	UBC[7:0]								0x00

Option byte no.	Description
OPT1	UBC[7:0]: User boot code area 0x00: no UBC, no write-protection 0x01: Pages 0 defined as UBC, memory write-protected 0x02: Pages 0 to 1 defined as UBC, memory write-protected Page 0 and page 1 contain the interrupt vectors. ... 0x7F: Pages 0 to 126 defined as UBC, memory write-protected Other values: Pages 0 to 127 defined as UBC, memory-write protected. <i>Note: Refer to the family reference manual (RM0016) section on Flash/EEPROM write protection for more details.</i>
OPT2	AFR[7:0] Refer to the following section for alternate function remapping descriptions of bits [7:2] and [1:0] respectively.
OPT3	HSITRIM: high-speed internal clock trimming register size 0: 3-bit trimming supported in CLK_HSITRIMR register 1: 4-bit trimming supported in CLK_HSITRIMR register
	LSI_EN: Low speed internal clock enable 0: LSI clock is not available as CPU clock source 1: LSI clock is available as CPU clock source
	IWDG_HW: Independent watchdog 0: IWDG Independent watchdog activated by software 1: IWDG Independent watchdog activated by hardware
	WWDG_HW: Window watchdog activation 0: WWDG window watchdog activated by software 1: WWDG window watchdog activated by hardware
	WWDG_HALT: Window watchdog reset on halt 0: No reset generated on halt if WWDG active 1: Reset generated on halt if WWDG active
OPT4	EXTCLK: External clock selection 0: External crystal connected to OSCIN/OSCOU 1: External clock signal on OSCIN
	CKAWUSEL: Auto wakeup unit/clock 0: LSI clock source selected for AWU 1: HSE clock with prescaler selected as clock source for for AWU
	PRSC[1:0] AWU clock prescaler 0x: 16 MHz to 128 kHz prescaler 10: 8 MHz to 128 kHz prescaler 11: 4 MHz to 128 kHz prescaler
OPT5	HSECNT[7:0]: HSE crystal oscillator stabilization time This configures the stabilization time. 0x00: 2048 HSE cycles 0xB4: 128 HSE cycles 0xD2: 8 HSE cycles 0xE1: 0.5 HSE cycles

8.1 Alternate function remapping bits

Table 14. STM8S003K3 alternate function remapping bits for 32-pin devices

Option byte number	Description ⁽¹⁾
OPT2	<p>AFR7 <i>Alternate function remapping option 7</i> Reserved.</p> <p>AFR6 <i>Alternate function remapping option 6</i> 0: AFR6 remapping option inactive: default alternate function⁽²⁾ 1: Port D7 alternate function = TIM1_CH4.</p> <p>AFR5 <i>Alternate function remapping option 5</i> 0: AFR5 remapping option inactive: default alternate function⁽²⁾ 1: Port D0 alternate function = CLK_CCO.</p> <p>AFR[4:2] <i>Alternate function remapping option 4:2</i> Reserved.</p> <p>AFR1 <i>Alternate function remapping option 1</i> 0: AFR1 remapping option inactive: default alternate function⁽²⁾ 1: Port A3 alternate function = SPI_NSS; port D2 alternate function TIM2_CH3</p> <p>AFR0 <i>Alternate function remapping option 0</i> Reserved.</p>

1. Do not use more than one remapping option in the same port. It is forbidden to enable both AFR1 and AFR0
2. Refer to the pinout description.

Table 15. STM8S003F3 alternate function remapping bits for 20-pin devices

Option byte number	Description
OPT2	AFR7 <i>Alternate function remapping option 7</i> 0: AFR7 remapping option inactive: default alternate function ⁽¹⁾ 1: Port C3 alternate function = TIM1_CH1N; port C4 alternate function = TIM1_CH2N.
	AFR6 <i>Alternate function remapping option 6</i> Reserved.
	AFR5 <i>Alternate function remapping option 5</i> Reserved.
	AFR4 <i>Alternate function remapping option 4</i> 0: AFR4 remapping option inactive: default alternate function ⁽¹⁾ . 1: Port B4 alternate function = ADC_ETR; port B5 alternate function = TIM1_BKIN.
	AFR3 <i>Alternate function remapping option 3</i> 0: AFR3 remapping option inactive: default alternate function ⁽¹⁾ 1: Port C3 alternate function = TLI.
	AFR2 <i>Alternate function remapping option 2</i> Reserved.
	AFR1 <i>Alternate function remapping option 1</i> ⁽²⁾ 0: AFR1 remapping option inactive: default alternate function ⁽¹⁾ 1: Port A3 alternate function = SPI_NSS; port D2 alternate function = TIM2_CH3.
	AFR0 <i>Alternate function remapping option 0</i> ⁽²⁾ 0: AFR0 remapping option inactive: Default alternate functions ⁽¹⁾ 1: Port C5 alternate function = TIM2_CH1; port C6 alternate function = TIM1_CH1; port C7 alternate function = TIM1_CH2.

1. Refer to the pinout description.

2. Do not use more than one remapping option in the same port. It is forbidden to enable both AFR1 and AFR0.

9 Electrical characteristics

9.1 Parameter conditions

Unless otherwise specified, all voltages are referred to V_{SS} .

9.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^{\circ}\text{C}$ and $T_A = T_{Amax}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean $\pm 3\sigma$).

9.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^{\circ}\text{C}$, $V_{DD} = 5\text{ V}$. They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean $\pm 2\sigma$).

9.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

9.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 7](#).

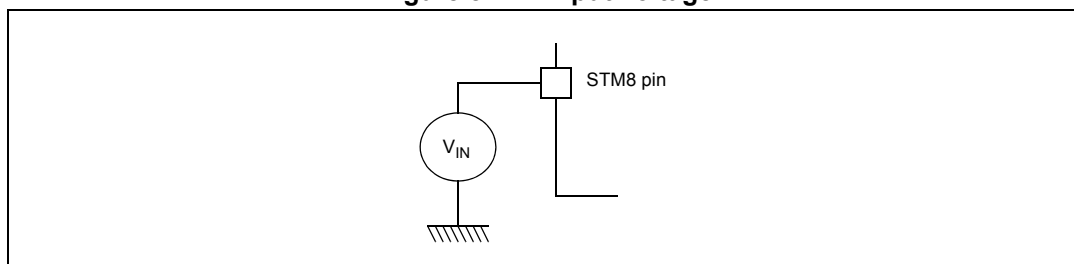

Figure 7. Pin loading conditions

9.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 8](#).

Figure 8. Pin input voltage

9.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 16: Voltage characteristics](#), [Table 17: Current characteristics](#) and [Table 18: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect the device's reliability.

The device's mission profile (application conditions) is compliant with JEDEC JESD47 Qualification Standard, extended mission profiles are available on demand.

Table 16. Voltage characteristics

Symbol	Ratings	Min	Max	Unit
$V_{DDx} - V_{SS}$	Supply voltage ⁽¹⁾	-0.3	6.5	V
V_{IN}	Input voltage on true open drain pins ⁽²⁾	$V_{SS} - 0.3$	6.5	
	Input voltage on any other pin ⁽²⁾	$V_{SS} - 0.3$	$V_{DD} + 0.3$	
$ V_{DDx} - V_{DD} $	Variations between different power pins	-	50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins	-	50	
V_{ESD}	Electrostatic discharge voltage	see Absolute maximum ratings (electrical sensitivity) on page 86		-

1. All power (V_{DD}) and ground (V_{SS}) pins must always be connected to the external power supply
2. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected

Table 17. Current characteristics

Symbol	Ratings	Max. ⁽¹⁾	Unit
I_{VDD}	Total current into V_{DD} power lines (source) ⁽²⁾	100	mA
I_{VSS}	Total current out of V_{SS} ground lines (sink) ⁽²⁾	80	
I_{IO}	Output current sunk by any I/O and control pin	20	
	Output current source by any I/Os and control pin	-20	
$I_{INJ(PIN)}^{(3)(4)}$	Injected current on NRST pin	±4	
	Injected current on OSCIN pin	±4	
	Injected current on any other pin ⁽⁵⁾	±4	
$\Sigma I_{INJ(PIN)}^{(3)}$	Total injected current (sum of all I/O and control pins) ⁽⁵⁾	±20	

1. Data based on characterization results.
2. All power (V_{DD}) and ground (V_{SS}) pins must always be connected to the external supply.
3. $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$. For true open-drain pads, there is no positive injection current, and the corresponding V_{IN} maximum must always be respected.
4. ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in the I/O port pin characteristics section does not affect the ADC accuracy.
5. When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 18. Thermal characteristics

Symbol	Ratings	Value	Unit
T_{STG}	Storage temperature range	-65 to 150	°C
T_J	Maximum junction temperature	150	

9.3 Operating conditions

The device must be used in operating conditions that respect the parameters in [Table 19](#). In addition, full account must be taken of all physical capacitor characteristics and tolerances.

Table 19. General operating conditions

Symbol	Parameter	Conditions	Min	Max	Unit
f_{CPU}	Internal CPU clock frequency	-	0	16	MHz
V_{DD}	Standard operating voltage	-	2.95	5.5	V
$V_{CAP}^{(1)}$	C_{EXT} : capacitance of external capacitor	-	470	3300	nF
	ESR of external capacitor	At 1 MHz ⁽²⁾	-	0.3	ohm
	ESL of external capacitor		-	15	nH
$P_D^{(3)}$	Power dissipation at $T_A = 85^\circ\text{C}$ for suffix 6	TSSOP20	-	238	mW
		UFQFPN20	-	220	
		LQFP32	-	330	
T_A	Ambient temperature for 6 suffix version	Maximum power dissipation	-40	85	$^\circ\text{C}$
T_J	Junction temperature range for 6 suffix version	-	-40	105	

1. Care should be taken when selecting the capacitor, due to its tolerance, as well as the parameter dependency on temperature, DC bias and frequency in addition to other factors. The parameter maximum values must be respected for the full application range.
2. This frequency of 1 MHz as a condition for V_{CAP} parameters is given by the design of the internal regulator.
3. To calculate $P_{Dmax}(T_A)$, use the formula $P_{Dmax} = (T_{Jmax} - T_A)/\Theta_{JA}$ (see [Section 10.4: Thermal characteristics on page 96](#)) with the value for T_{Jmax} given in [Table 19](#) above and the value for Θ_{JA} given in [Table 55: Thermal characteristics](#).

Figure 9. f_{CPUmax} versus V_{DD}

MS36411V1

Table 20. Operating conditions at power-up/power-down

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{VDD}	V_{DD} rise time rate	-	2	-	∞	$\mu\text{s/V}$
	V_{DD} fall time rate ⁽¹⁾	-	2	-	∞	
t_{TEMP}	Reset release delay	V_{DD} rising	-	-	1.7	ms
V_{IT+}	Power-on reset threshold	-	2.6	2.7	2.85	V
V_{IT-}	Brown-out reset threshold	-	2.5	2.65	2.8	V
$V_{HYS(BOR)}$	Brown-out reset hysteresis	-	-	70	-	mV

1. Reset is always generated after a t_{TEMP} delay. The application must ensure that V_{DD} is still above the minimum operating voltage ($V_{DD \text{ min}}$) when the t_{TEMP} delay has elapsed.

9.3.1 VCAP external capacitor

Stabilization for the main regulator is achieved connecting an external capacitor C_{EXT} to the V_{CAP} pin. C_{EXT} is specified in [Table 19](#). Care should be taken to limit the series inductance to less than 15 nH.

Figure 10. External capacitor C_{EXT}

1. Legend: ESR is the equivalent series resistance and ESL is the equivalent inductance.

9.3.2 Supply current characteristics

The current consumption is measured as described in [Section 9.1.5: Pin input voltage](#).

Total current consumption in run mode

The MCU is placed under the following conditions:

- All I/O pins in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled (clock stopped by Peripheral Clock Gating registers) except if explicitly mentioned.

Subject to general operating conditions for V_{DD} and T_A .

Table 21. Total current consumption with code execution in run mode at $V_{DD} = 5\text{ V}$

Symbol	Parameter	Conditions		Typ	Max ⁽¹⁾	Unit
I _{DD(RUN)}	Supply current in run mode, code executed from RAM	f _{CPU} = f _{MASTER} = 16 MHz	HSE crystal osc. (16 MHz)	2.3	-	mA
			HSE user ext. clock (16 MHz)	2	2.35	
			HSI RC osc. (16 MHz)	1.7	2	
		f _{CPU} = f _{MASTER} /128 = 125 kHz	HSE user ext. clock (16 MHz)	0.86	-	
			HSI RC osc. (16 MHz)	0.7	0.87	
		f _{CPU} = f _{MASTER} /128 = 15.625 kHz	HSI RC osc. (16 MHz/8)	0.46	0.58	
	f _{CPU} = f _{MASTER} = 128 kHz	LSI RC osc. (128 kHz)	0.41	0.55		
	Supply current in run mode, code executed from Flash	f _{CPU} = f _{MASTER} = 16 MHz	HSE crystal osc. (16 MHz)	4.5	-	
			HSE user ext. clock (16 MHz)	4.3	4.75	
			HSI RC osc.(16 MHz)	3.7	4.5	
		f _{CPU} = f _{MASTER} = 2 MHz	HSI RC osc. (16 MHz/8) ⁽²⁾	0.84	1.05	
		f _{CPU} = f _{MASTER} /128 = 125 kHz	HSI RC osc. (16 MHz)	0.72	0.9	
		f _{CPU} = f _{MASTER} /128 = 15.625 kHz	HSI RC osc. (16 MHz/8)	0.46	0.58	
		f _{CPU} = f _{MASTER} = 128 kHz	LSI RC osc. (128 kHz)	0.42	0.57	

1. Data based on characterization results.

2. Default clock configuration measured with all peripherals off.

Table 22. Total current consumption with code execution in run mode at $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions		Typ	Max ⁽¹⁾	Unit
$I_{DD(RUN)}$	Supply current in run mode, code executed from RAM	$f_{CPU} = f_{MASTER} = 16\text{ MHz}$	HSE crystal osc. (16 MHz)	1.8	-	mA
			HSE user ext. clock (16 MHz)	2	2.3	
			HSI RC osc. (16 MHz)	1.5	2	
		$f_{CPU} = f_{MASTER}/128 = 125\text{ kHz}$	HSE user ext. clock (16 MHz)	0.81	-	
			HSI RC osc. (16 MHz)	0.7	0.87	
		$f_{CPU} = f_{MASTER}/128 = 15.625\text{ kHz}$	HSI RC osc. (16MHz/8)	0.46	0.58	
		$f_{CPU} = f_{MASTER} = 128\text{ kHz}$	LSI RC osc. (128 kHz)	0.41	0.55	
	Supply current in run mode, code executed from Flash	$f_{CPU} = f_{MASTER} = 16\text{ MHz}$	HSE crystal osc. (16 MHz)	4	-	
			HSE user ext. clock (16 MHz)	3.9	4.7	
			HSI RC osc. (16 MHz)	3.7	4.5

		$f_{CPU} = f_{MASTER} = 128\text{ kHz}$	LSI RC osc. (128 kHz)	0.4	0.54	

1. Data based on characterization results.

2. Default clock configuration measured with all peripherals off.

Table 24. Total current consumption in wait mode at $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions		Typ	Max ⁽¹⁾	Unit
$I_{DD(WFI)}$	Supply current in wait mode	$f_{CPU} = f_{MASTER} = 16\text{ MHz}$	HSE crystal osc. (16 MHz)	1.1	-	mA
			HSE user ext. clock (16 MHz)	1.1	1.3	
			HSI RC osc. (16 MHz)	0.89	1.1	
		$f_{CPU} = f_{MASTER}/128 = 125\text{ kHz}$	HSI RC osc. (16 MHz)	0.7	0.88	
		$f_{CPU} = f_{MASTER}/128 = 15.625\text{ kHz}$	HSI RC osc. (16 MHz/8) ⁽²⁾	0.45	0.57	
		$f_{CPU} = f_{MASTER}/128 = 15.625\text{ kHz}$	LSI RC osc. (128 kHz)	0.4	0.54	

1. Data based on characterization results.

2. Default clock configuration measured with all peripherals off.

Total current consumption in active halt mode

Table 25. Total current consumption in active halt mode at $V_{DD} = 5\text{ V}$

Symbol	Parameter	Conditions			Typ	Max at 85° C ⁽¹⁾	Unit
		Main voltage regulator (MVR) ⁽²⁾	Flash mode ⁽³⁾	Clock source			
$I_{DD(AH)}$	Supply current in active halt mode	On	Operating mode	HSE crystal oscillator (16 MHz)	1030	-	μA
				LSI RC oscillator (128 kHz)	200	260	
			Power-down mode	HSE crystal oscillator (16 MHz)	970	-	
				LSI RC oscillator (128 kHz)	150	200	
		Off	Operating mode	LSI RC oscillator (128 kHz)	66	85	
			Power-down mode		10	20	

1. Data based on characterization results.

2. Configured by the REGAH bit in the CLK_ICKR register.

3. Configured by the AHALT bit in the FLASH_CR1 register.

Table 26. Total current consumption in active halt mode at $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions			Typ	Max at 85° C ⁽¹⁾	Unit
		Main voltage regulator (MVR) ⁽²⁾	Flash mode ⁽³⁾	Clock source			
$I_{DD(AH)}$	Supply current in active halt mode	On	Operating mode	HSE crystal osc. (16 MHz)	550	-	μA
				LSI RC osc. (128 kHz)	200	260	
			Power-down mode	HSE crystal osc. (16 MHz)	970	-	
				LSI RC osc. (128 kHz)	150	200	
		Off	Operating mode	LSI RC osc. (128 kHz)	66	80	
			Power-down mode		10	18	

1. Data based on characterization results.

2. Configured by the REGAH bit in the CLK_ICKR register.

3. Configured by the AHALT bit in the FLASH_CR1 register.

Total current consumption in halt mode

Table 27. Total current consumption in halt mode at $V_{DD} = 5\text{ V}$

Symbol	Parameter	Conditions	Typ	Max at 85°C ⁽¹⁾	Unit
$I_{DD(H)}$	Supply current in halt mode	Flash in operating mode, HSI clock after wakeup	63	75	μA
		Flash in power-down mode, HSI clock after wakeup	6.0	20	

1. Data based on characterization results.

Table 28. Total current consumption in halt mode at $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions	Typ	Max at 85°C ⁽¹⁾	Unit
$I_{DD(H)}$	Supply current in halt mode	Flash in operating mode, HSI clock after wakeup	60	75	μA
		Flash in power-down mode, HSI clock after wakeup	4.5	17	

1. Data based on characterization results.

Low-power mode wakeup times

Table 29. Wakeup times

Symbol	Parameter	Conditions		Typ	Max ⁽¹⁾	Unit
$t_{WU(WFI)}$	Wakeup time from wait mode to run mode ⁽³⁾	0 to 16 MHz		-	_(2)	μs
		$f_{CPU} = f_{MASTER} = 16\text{ MHz}$.		0.56	-	
$t_{WU(AH)}$	Wakeup time active halt mode to run mode. ⁽³⁾	MVR voltage regulator on ⁽⁴⁾	Flash in operating mode ⁽⁵⁾	HSI (after wakeup)	1 ⁽⁶⁾	2 ⁽⁶⁾
			Flash in power-down mode ⁽⁵⁾		3 ⁽⁶⁾	-
		MVR voltage regulator off ⁽⁴⁾	Flash in operating mode ⁽⁵⁾		48 ⁽⁶⁾	-
			Flash in power-down mode ⁽⁵⁾		50 ⁽⁶⁾	-
$t_{WU(H)}$	Wakeup time from halt mode to run mode ⁽³⁾	Flash in operating mode ⁽⁵⁾		52	-	
		Flash in power-down mode ⁽⁵⁾		54	-	

1. Data guaranteed by design.

2. $t_{WU(WFI)} = 2 \times 1/f_{master} + 7 \times 1/f_{CPU}$

3. Measured from interrupt event to interrupt vector fetch.

4. Configured by the REGAH bit in the CLK_ICR register.

5. Configured by the AHALT bit in the FLASH_CR1 register.

6. Plus 1 LSI clock depending on synchronization.

Total current consumption and timing in forced reset state**Table 30. Total current consumption and timing in forced reset state**

Symbol	Parameter	Conditions	Typ	Max ⁽¹⁾	Unit
$I_{DD(R)}$	Supply current in reset state ⁽²⁾	$V_{DD} = 5\text{ V}$	400	-	μA
		$V_{DD} = 3.3\text{ V}$	300	-	
t_{RESETBL}	Reset pin release to vector fetch	-	-	150	μs

1. Data guaranteed by design.

2. Characterized with all I/Os tied to V_{SS} .

Current consumption of on-chip peripherals

Subject to general operating conditions for V_{DD} and T_A .

HSI internal $RC/f_{\text{CPU}} = f_{\text{MASTER}} = 16\text{ MHz}$, $V_{DD} = 5\text{ V}$.

Table 31. Peripheral current consumption

Symbol	Parameter	Typ.	Unit
$I_{DD(\text{TIM1})}$	TIM1 supply current ⁽¹⁾	210	μA
$I_{DD(\text{TIM2})}$	TIM2 supply current ⁽¹⁾	130	
$I_{DD(\text{TIM4})}$	TIM4 timer supply current ⁽¹⁾	50	
$I_{DD(\text{UART1})}$	UART1 supply current ⁽¹⁾	120	
$I_{DD(\text{SPI})}$	SPI supply current ⁽¹⁾	45	
$I_{DD(\text{I2C})}$	I ² C supply current ⁽¹⁾	65	
$I_{DD(\text{ADC1})}$	ADC1 supply current when converting ⁽¹⁾	1000	

1. Data based on a differential I_{DD} measurement between reset configuration and timer counter running at 16 MHz. No IC/OC programmed (no I/O pads toggling). Not tested in production.

Current consumption curves

The following figures show the typical current consumption measured with code executing in RAM.

Figure 11. Typ. $I_{DD(RUN)}$ vs V_{DD} , HSE user external clock, $f_{CPU} = 16$ MHz

Figure 12. Typ. $I_{DD(RUN)}$ vs f_{CPU} , HSE user external clock, $V_{DD} = 5$ V

Figure 13. Typ. $I_{DD(RUN)}$ vs V_{DD} , HSI RC osc, $f_{CPU} = 16\text{ MHz}$ Figure 14. Typ. $I_{DD(WFI)}$ vs. V_{DD} HSE user external clock, $f_{CPU} = 16\text{ MHz}$ 

Figure 15. Typ. $I_{DD(WFI)}$ vs. f_{CPU} , HSE user external clock, $V_{DD} = 5\text{ V}$ Figure 16. Typ. $I_{DD(WFI)}$ vs V_{DD} , HSI RC osc, $f_{CPU} = 16\text{ MHz}$ 

9.3.3 External clock sources and timing characteristics

HSE user external clock

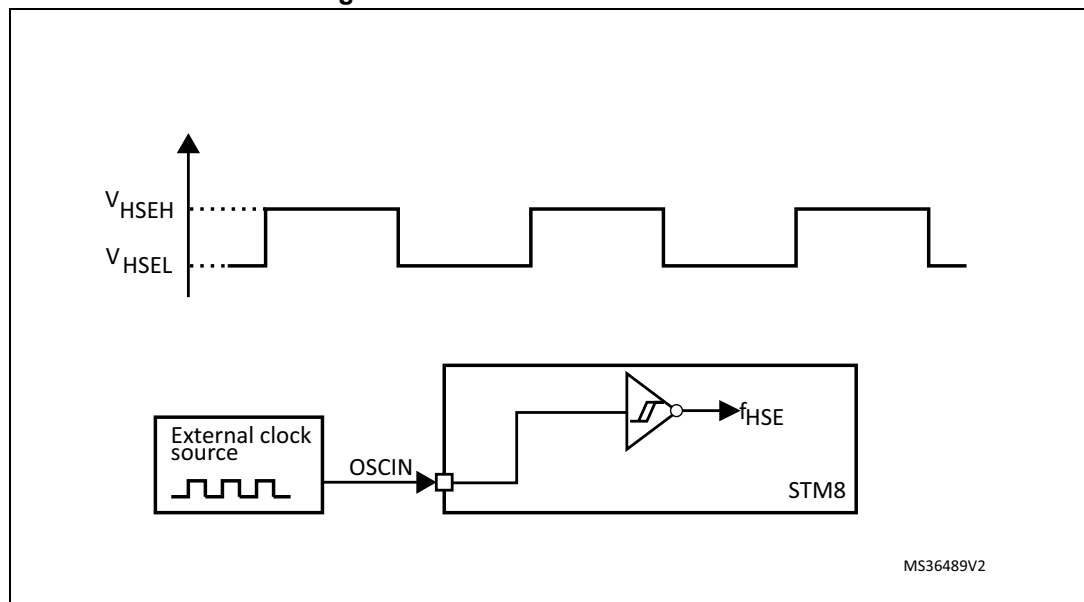

Subject to general operating conditions for V_{DD} and T_A .

Table 32. HSE user external clock characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	-	0	-	16	MHz
$V_{HSEH}^{(1)}$	OSCIN input pin high level voltage		$0.7 \times V_{DD}$	-	$V_{DD} + 0.3 \text{ V}$	V
$V_{HSEL}^{(1)}$	OSCIN input pin low level voltage		V_{SS}	-	$0.3 \times V_{DD}$	
I_{LEAK_HSE}	OSCIN input leakage current	$V_{SS} < V_{IN} < V_{DD}$	-1	-	+1	μA

1. Data based on characterization results.

Figure 17. HSE external clock source

HSE crystal/ceramic resonator oscillator

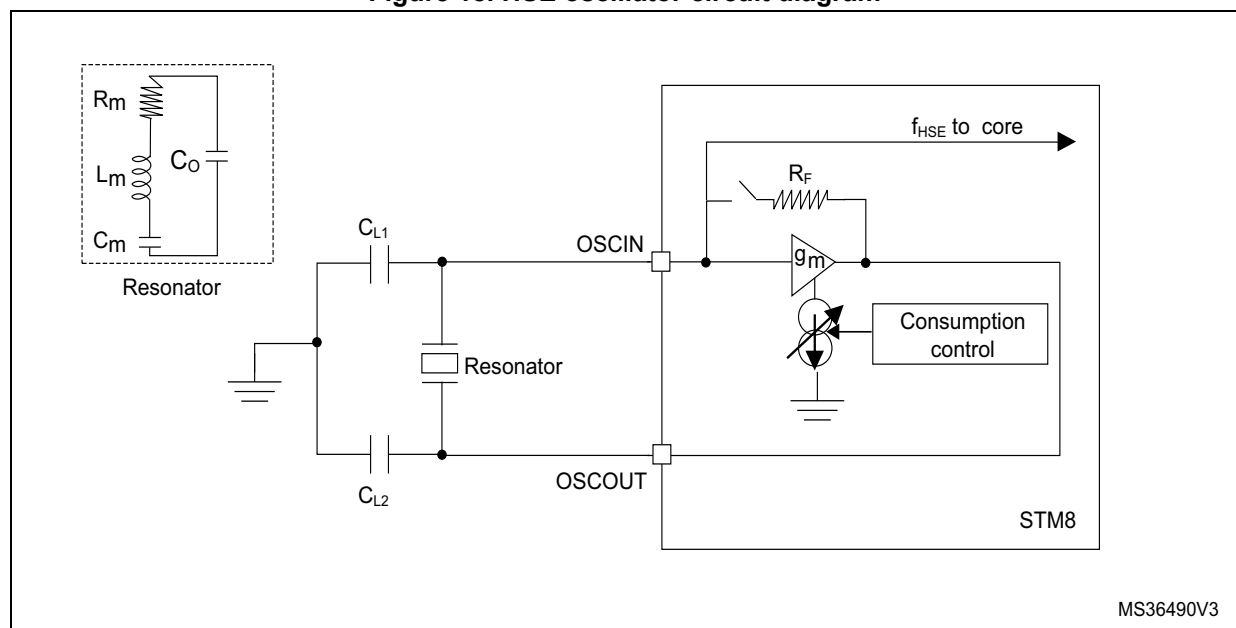

The HSE clock can be supplied with a 1 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph is based on characterization results with specified typical external components. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and start-up stabilization time. Refer to the crystal resonator manufacturer for more details (frequency, package, accuracy...).

Table 33. HSE oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE}	External high speed oscillator frequency	-	1	-	16	MHz
R_F	Feedback resistor	-	-	220	-	k Ω
$C^{(1)}$	Recommended load capacitance ⁽²⁾	-	-	-	20	pF
$I_{DD(HSE)}$	HSE oscillator power consumption	$C = 20 \text{ pF}$, $f_{OSC} = 16 \text{ MHz}$	-	-	6 (startup) 1.6 (stabilized) ⁽³⁾	mA
		$C = 10 \text{ pF}$, $f_{OSC} = 16 \text{ MHz}$	-	-	6 (startup) 1.2 (stabilized) ⁽³⁾	
g_m	Oscillator transconductance	-	5	-	-	mA/V
$t_{SU(HSE)}^{(4)}$	Startup time	V_{DD} is stabilized	-	1	-	ms

1. C is approximately equivalent to 2 x crystal Cload.
2. The oscillator selection can be optimized in terms of supply current using a high quality resonator with small R_m value. Refer to crystal manufacturer for more details
3. Data based on characterization results.
4. $t_{SU(HSE)}$ is the start-up time measured from the moment it is enabled (by software) to a stabilized 16 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Figure 18. HSE oscillator circuit diagram

HSE oscillator critical g_m formula

$$g_{m\text{crit}} = (2 \times \Pi \times f_{\text{HSE}})^2 \times R_m (2C_o + C)^2$$

R_m : Notional resistance (see crystal specification)

L_m : Notional inductance (see crystal specification)

C_m : Notional capacitance (see crystal specification)

C_o : Shunt capacitance (see crystal specification)

$C_{L1}=C_{L2}=C$: Grounded external capacitance

$g_m \gg g_{m\text{crit}}$

9.3.4 Internal clock sources and timing characteristics

Subject to general operating conditions for V_{DD} and T_A .

High speed internal RC oscillator (HSI)**Table 34. HSI oscillator characteristics**

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSI}	Frequency	-	-	16	-	MHz
ACC_{HSI}	Accuracy of HSI oscillator	User-trimmed with the CLK_HSITRIMR register for given V_{DD} and T_A conditions ⁽¹⁾	-	-	1.0 ⁽²⁾	%
	Accuracy of HSI oscillator (factory calibrated)	$V_{DD} = 5 \text{ V}$, $-40^\circ\text{C} \leq T_A \leq 85^\circ\text{C}$	-5	-	5	
$t_{\text{su(HSI)}}$	HSI oscillator wakeup time including calibration	-	-	-	1.0 ⁽²⁾	μs
$I_{DD(\text{HSI})}$	HSI oscillator power consumption	-	-	170	250 ⁽³⁾	μA

1. See the application note.

2. Guaranteed by design.

3. Data based on characterization results.

Figure 19. Typical HSI frequency variation vs V_{DD} at 4 temperatures**Low speed internal RC oscillator (LSI)**

Subject to general operating conditions for V_{DD} and T_A .

Table 35. LSI oscillator characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	Frequency	-	-	128	-	kHz
$t_{su(LSI)}$	LSI oscillator wakeup time	-	-	-	7 ⁽¹⁾	μs
$I_{DD(LSI)}$	LSI oscillator power consumption	-	-	5	-	μA

1. Guaranteed by design.

Figure 20. Typical LSI frequency variation vs V_{DD} @ 4 temperatures

9.3.5 Memory characteristics

RAM and hardware registers

Table 36. RAM and hardware registers

Symbol	Parameter	Conditions	Min	Unit
V_{RM}	Data retention mode ⁽¹⁾	Halt mode (or reset)	V_{IT-max} ⁽²⁾	V

1. Minimum supply voltage without losing data stored in RAM (in halt mode or under reset) or in hardware registers (only in halt mode). Guaranteed by design.

2. Refer to [Table 20 on page 50](#) for the value of V_{IT-max} .

Flash program memory and data EEPROM

General conditions: $T_A = -40$ to $85\text{ }^{\circ}\text{C}$.

Table 37. Flash program memory and data EEPROM

Symbol	Parameter	Conditions	Min ⁽¹⁾	Typ	Max	Unit
V_{DD}	Operating voltage (all modes, execution/write/erase)	$f_{CPU} \leq 16\text{ MHz}$	2.95	-	5.5	V
t_{prog}	Standard programming time (including erase) for byte/word/block (1 byte/4 bytes/64 bytes)	-	-	6.0	6.6	ms
	Fast programming time for 1 block (64 bytes)	-	-	3.0	3.3	ms
t_{erase}	Erase time for 1 block (64 bytes)	-	-	3.0	3.3	ms
N_{RW}	Erase/write cycles ⁽²⁾ (program memory)	$T_A = 85\text{ }^{\circ}\text{C}$	100	-	-	cycles
	Erase/write cycles ⁽²⁾ (data memory)		100 k	-	-	
t_{RET}	Data retention (program memory) after 100 erase/write cycles at $T_A = 85\text{ }^{\circ}\text{C}$	$T_{RET} = 55\text{ }^{\circ}\text{C}$	20	-	-	years
	Data retention (data memory) after 10 k erase/write cycles at $T_A = 85\text{ }^{\circ}\text{C}$		20	-	-	
	Data retention (data memory) after 100 k erase/write cycles at $T_A = 85\text{ }^{\circ}\text{C}$	$T_{RET} = 85\text{ }^{\circ}\text{C}$	1.0	-	-	
I_{DD}	Supply current (Flash programming or erasing for 1 to 128 bytes)	-	-	2.0	-	mA

1. Data based on characterization results.

2. The physical granularity of the memory is 4 bytes, so cycling is performed on 4 bytes even when a write/erase operation addresses a single byte.

9.3.6 I/O port pin characteristics

General characteristics

Subject to general operating conditions for V_{DD} and T_A unless otherwise specified. All unused pins must be kept at a fixed voltage: using the output mode of the I/O for example or an external pull-up or pull-down resistor.

Table 38. I/O static characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{IL}	Input low level voltage	$V_{DD} = 5\text{ V}$	-0.3	-	$0.3 \times V_{DD}$	V
V_{IH}	Input high level voltage		$0.7 \times V_{DD}$	-	$V_{DD} + 0.3\text{ V}$	V
V_{hys}	Hysteresis ⁽¹⁾		-	700	-	mV
R_{pu}	Pull-up resistor	$V_{DD} = 5\text{ V}, V_{IN} = V_{SS}$	30	55	80	k Ω
t_R, t_F	Rise and fall time (10% - 90%)	Fast I/Os Load = 50 pF	-	-	$20^{(2)}$	ns
		Standard and high sink I/Os Load = 50 pF	-	-	$125^{(2)}$	ns
I_{lkg}	Input leakage current, analog and digital	$V_{SS} \leq V_{IN} \leq V_{DD}$	-	-	± 1	μA
$I_{lkg\text{ ana}}$	Analog input leakage current	$V_{SS} \leq V_{IN} \leq V_{DD}$	-	-	$\pm 250^{(3)}$	nA
$I_{lkg(inj)}$	Leakage current in adjacent I/O	Injection current $\pm 4\text{ mA}$	-	-	$\pm 1^{(3)}$	μA

1. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization results.
2. Data guaranteed by design.
3. Data based on characterization results.

Figure 21. Typical V_{IL} and V_{IH} vs V_{DD} @ 4 temperaturesFigure 22. Typical pull-up resistance vs V_{DD} @ 4 temperatures

Figure 23. Typical pull-up current vs V_{DD} @ 4 temperatures

1. The pull-up is a pure resistor (slope goes through 0).

Table 39. Output driving current (standard ports)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}	Output low level with 8 pins sunk	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 5 \text{ V}$	-	2	V
	Output low level with 4 pins sunk	$I_{IO} = 4 \text{ mA}$, $V_{DD} = 3.3 \text{ V}$	-	1 ⁽¹⁾	
V_{OH}	Output high level with 8 pins sourced	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 5 \text{ V}$	2.8	-	V
	Output high level with 4 pins sourced	$I_{IO} = 4 \text{ mA}$, $V_{DD} = 3.3 \text{ V}$	2.1 ⁽¹⁾	-	

1. Data based on characterization results.

Table 40. Output driving current (true open drain ports)

Symbol	Parameter	Conditions	Max	Unit
V_{OL}	Output low level with 2 pins sunk	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 5 \text{ V}$	1	V
		$I_{IO} = 10 \text{ mA}$, $V_{DD} = 3.3 \text{ V}$	1.5 ⁽¹⁾	
		$I_{IO} = 20 \text{ mA}$, $V_{DD} = 5 \text{ V}$	2 ⁽¹⁾	

1. Data based on characterization results.

Table 41. Output driving current (high sink ports)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{OL}	Output low level with 8 pins sunk	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 5 \text{ V}$	-	0.8	V
	Output low level with 4 pins sunk	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 3.3 \text{ V}$	-	1.0 ⁽¹⁾	
	Output low level with 4 pins sunk	$I_{IO} = 20 \text{ mA}$, $V_{DD} = 5 \text{ V}$	-	1.5 ⁽¹⁾	
V_{OH}	Output high level with 8 pins sourced	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 5 \text{ V}$	4.0	-	
	Output high level with 4 pins sourced	$I_{IO} = 10 \text{ mA}$, $V_{DD} = 3.3 \text{ V}$	2.1 ⁽¹⁾	-

$t_{OP(NRST)}$	NRST output pulse ⁽¹⁾	-	20	-	-	μs

1. Data based on characterization results.

2. The R_{PU} pull-up equivalent resistor is based on a resistive transistor.

3. Data guaranteed by design.

Figure 34. Typical NRST V_{IL} and V_{IH} vs V_{DD} @ 4 temperatures

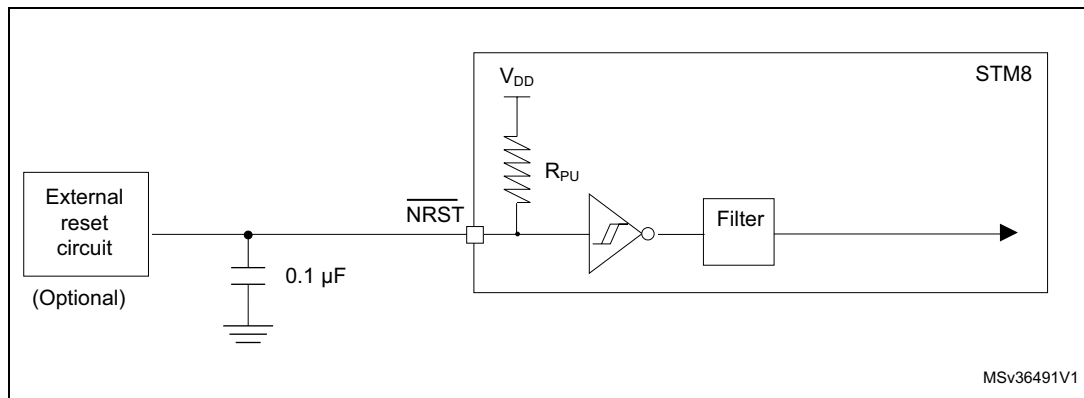

Figure 35. Typical NRST pull-up resistance vs V_{DD} @ 4 temperaturesFigure 36. Typical NRST pull-up current vs V_{DD} @ 4 temperatures

The reset network shown in [Figure 37](#) protects the device against parasitic resets. The user must ensure that the level on the NRST pin can go below the V_{IL} max. level specified in [Table 38](#). Otherwise the reset is not taken into account internally. For power consumption sensitive applications, the capacity of the external reset capacitor can be reduced to limit charge/discharge current. If the NRST signal is used to reset the external circuitry, care must be taken of the charge/discharge time of the external capacitor to fulfill the external device's reset timing conditions. The minimum recommended capacity is 10 nF.

Figure 37. Recommended reset pin protection

9.3.8 SPI serial peripheral interface

Unless otherwise specified, the parameters given in [Table 43](#) are derived from tests performed under ambient temperature, f_{MASTER} frequency and V_{DD} supply voltage conditions. $t_{\text{MASTER}} = 1/f_{\text{MASTER}}$.

Refer to I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO).

Table 43. SPI characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f_{SCK} $1/t_{\text{c(SCK)}}$	SPI clock frequency	Master mode	0	8	MHz
		Slave mode	0	7	
$t_{\text{r(SCK)}}$ $t_{\text{f(SCK)}}$	SPI clock rise and fall time	Capacitive load: $C = 30 \text{ pF}$	-	25	ns
$t_{\text{su(NSS)}}^{(1)}$	NSS setup time	Slave mode	$4 \times t_{\text{MASTER}}$	-	
$t_{\text{h(NSS)}}^{(1)}$	NSS hold time	Slave mode	70	-	
$t_{\text{w(SCKH)}}^{(1)}$ $t_{\text{w(SCKL)}}^{(1)}$	SCK high and low time	Master mode	$t_{\text{SCK}}/2 - 15$	$t_{\text{SCK}}/2 + 15$	
$t_{\text{su(MI)}}^{(1)}$ $t_{\text{su(SI)}}^{(1)}$	Data input setup time	Master mode	5	-	
		Slave mode	5	-	
$t_{\text{h(MI)}}^{(1)}$ $t_{\text{h(SI)}}^{(1)}$	Data input hold time	Master mode	7	-	
		Slave mode	10	-	
$t_{\text{a(SO)}}^{(1)(2)}$	Data output access time	Slave mode	-	$3 \times t_{\text{MASTER}}$	
$t_{\text{dis(SO)}}^{(1)(3)}$	Data output disable time	Slave mode	25	-	
$t_{\text{v(SO)}}^{(1)}$	Data output valid time	Slave mode (after enable edge)	-	65	
$t_{\text{v(MO)}}^{(1)}$	Data output valid time	Master mode (after enable edge)	-	30	
$t_{\text{h(SO)}}^{(1)}$	Data output hold time	Slave mode (after enable edge)	27	-	
$t_{\text{h(MO)}}^{(1)}$		Master mode (after enable edge)	11	-	

1. Values based on design simulation and/or characterization results, and not tested in production.

2. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.

3. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z.

Figure 38. SPI timing diagram - slave mode and CPHA = 0

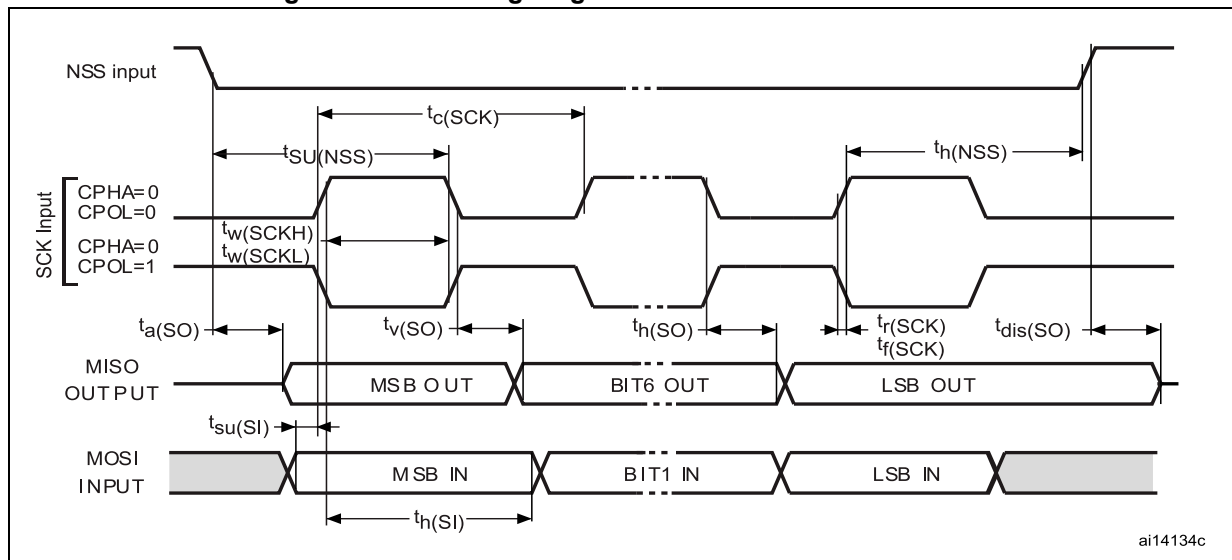

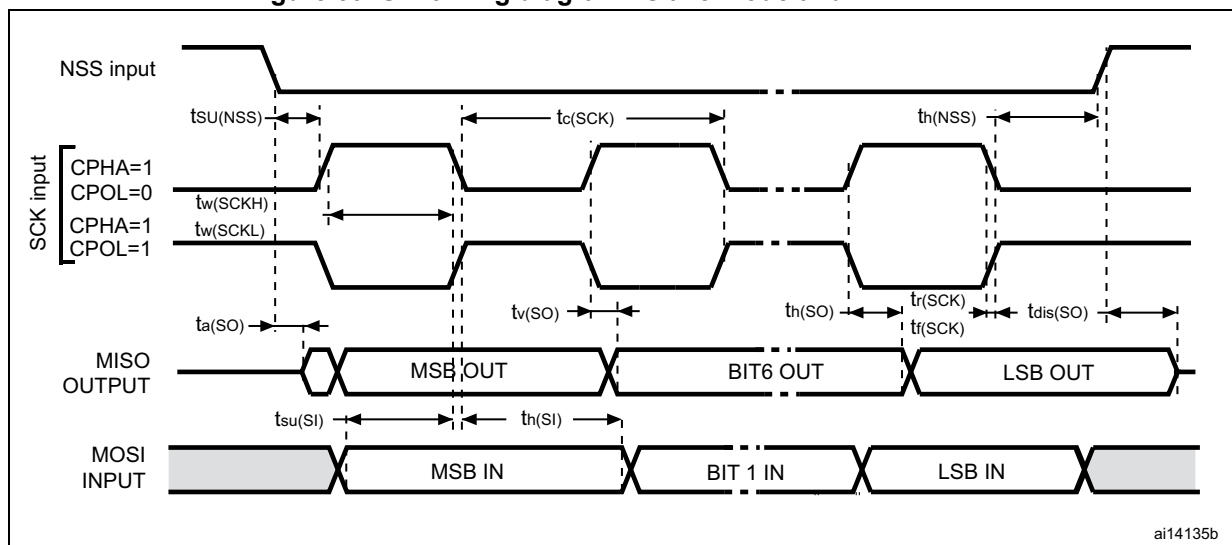

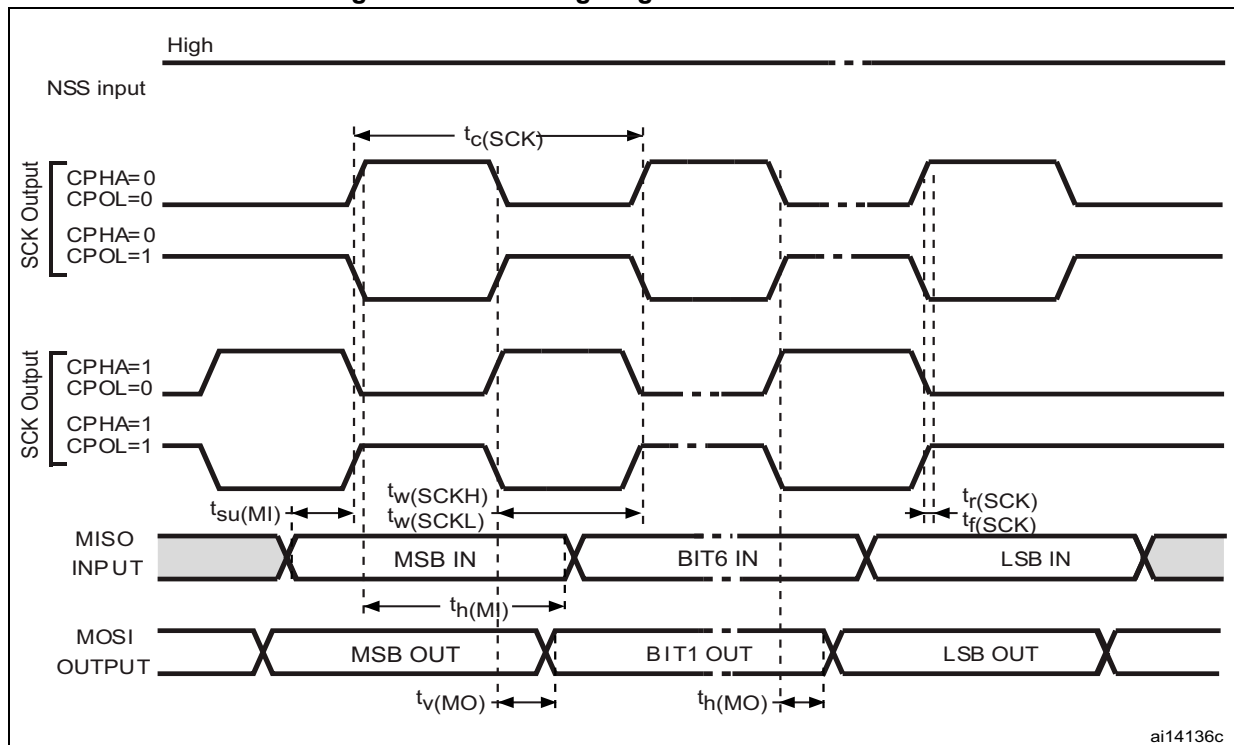

Figure 39. SPI timing diagram - slave mode and CPHA = 1⁽¹⁾

9.3.9 I²C interface characteristicsTable 44. I²C characteristics

Symbol	Parameter	Standard mode I ² C		Fast mode I ² C ⁽¹⁾		Unit
		Min ⁽²⁾	Max ⁽²⁾	Min ⁽²⁾	Max ⁽²⁾	
t _{w(SCLL)}	SCL clock low time	4.7	-	1.3	-	μs
t _{w(SCLH)}	SCL clock high time	4.0	-	0.6	-	
t _{su(SDA)}	SDA setup time	250	-	100	-	ns
t _{h(SDA)}	SDA data hold time	0 ⁽³⁾	-	0 ⁽⁴⁾	900 ⁽³⁾	
t _{r(SDA)} t _{r(SCL)}	SDA and SCL rise time	-	1000	-	300	
t _{f(SDA)} t _{f(SCL)}	SDA and SCL fall time	-	300	-	300	
t _{h(STA)}	START condition hold time	4.0	-	0.6	-	μs
t _{su(STA)}	Repeated START condition setup time	4.7	-	0.6	-	
t _{su(STO)}	STOP condition setup time	4.0	-	0.6	-	μs
t _{w(STO:STA)}	STOP to START condition time (bus free)	4.7	-	1.3	-	μs
C _b	Capacitive load for each bus line	-	400	-	400	pF

1. f_{MASTER}, must be at least 8 MHz to achieve max fast I²C speed (400kHz)
2. Data based on standard I²C protocol requirement, not tested in production
3. The maximum hold time of the start condition has only to be met if the interface does not stretch the low time
4. The device must internally provide a hold time of at least 300 ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL

Figure 41. Typical application with I²C bus and timing diagram

1. Measurement points are made at CMOS levels: $0.3 \times V_{DD}$ and $0.7 \times V_{DD}$

9.3.10 10-bit ADC characteristics

Subject to general operating conditions for V_{DDA} , f_{MASTER} , and T_A unless otherwise specified.

Table 45. ADC characteristics

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{ADC}	ADC clock frequency	$V_{DDA} = 3 \text{ to } 5.5 \text{ V}$	1	-	4	MHz
		$V_{DDA} = 4.5 \text{ to } 5.5 \text{ V}$	1	-	6	
V_{AIN}	Conversion voltage range ⁽¹⁾	-	V_{SS}	-	V_{DD}	V
C_{ADC}	Internal sample and hold capacitor	-	-	3	-	pF
$t_S^{(1)}$	Sampling time	$f_{ADC} = 4 \text{ MHz}$	-	0.75	-	μs
		$f_{ADC} = 6 \text{ MHz}$	-	0.5	-	
t_{STAB}	Wakeup time from standby	-	-	7	-	μs
t_{CONV}	Total conversion time (including sampling time, 10-bit resolution)	$f_{ADC} = 4 \text{ MHz}$	3.5			μs
		$f_{ADC} = 6 \text{ MHz}$	2.33			μs
		-	14			$1/f_{ADC}$

1. During the sample time the input capacitance C_{AIN} (3 pF max) can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_S . After the end of the sample time t_S , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_S depend on programming.

Table 46. ADC accuracy with $R_{AIN} < 10 \text{ k}\Omega$, $V_{DD} = 5 \text{ V}$

Symbol	Parameter	Conditions	Typ	Max ⁽¹⁾	Unit
$ E_T $	Total unadjusted error ⁽²⁾	$f_{ADC} = 2 \text{ MHz}$	1.6	3.5	LSB
		$f_{ADC} = 4 \text{ MHz}$	2.2	4	
		$f_{ADC} = 6 \text{ MHz}$	2.4	4.5	
$ E_O $	Offset error ⁽²⁾	$f_{ADC} = 2 \text{ MHz}$	1.1	2.5	
		$f_{ADC} = 4 \text{ MHz}$	1.5	3	
		$f_{ADC} = 6 \text{ MHz}$	1.8	3	
$ E_G $	Gain error ⁽²⁾	$f_{ADC} = 2 \text{ MHz}$	1.5	3	
		$f_{ADC} = 4 \text{ MHz}$	2.1	3

$ E_D $	Differential linearity error ⁽²⁾	$f_{ADC} = 2 \text{ MHz}$	0.7	1.5	
		$f_{ADC} = 4 \text{ MHz}$	0.7	1.5	
		$f_{ADC} = 6 \text{ MHz}$	0.7	1.5	
$ E_L $	Integral linearity error ⁽²⁾	$f_{ADC} = 2 \text{ MHz}$	0.6	1.5	
		$f_{ADC} = 4 \text{ MHz}$	0.8	2	
		$f_{ADC} = 6 \text{ MHz}$	0.8	2	

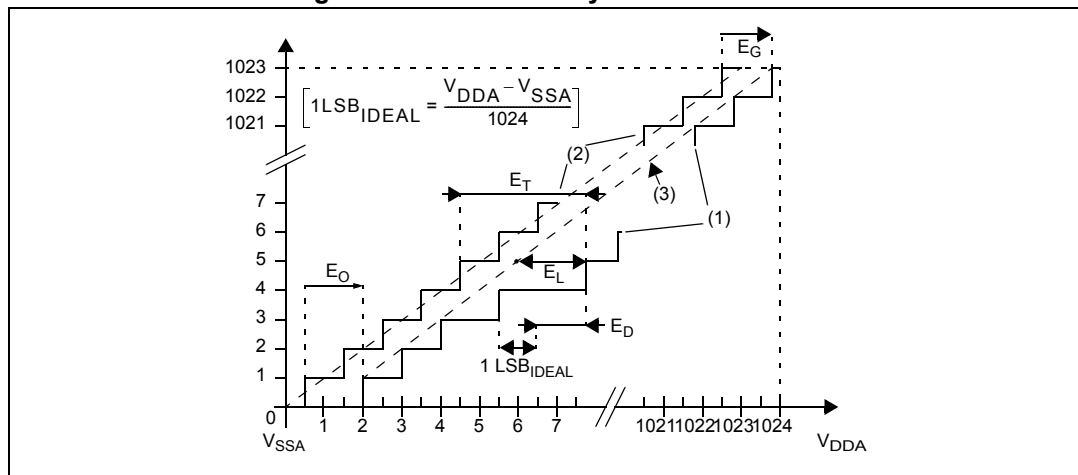

1. Data based on characterization results.
2. ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in [Section 9.3.6](#) does not affect the ADC accuracy.

Table 47. ADC accuracy with $R_{AIN} < 10\text{ k}\Omega$, R_{AIN} , $V_{DD} = 3.3\text{ V}$

Symbol	Parameter	Conditions	Typ	Max ⁽¹⁾	Unit

		f _{ADC} = 4 MHz	2	3	
E _D	Differential linearity error ⁽²⁾	f _{ADC} = 2 MHz	0.7	1.0	
		f _{ADC} = 4 MHz	0.7	1.5	
E _L	Integral linearity error ⁽²⁾	f _{ADC} = 2 MHz	0.6	1.5	
		f _{ADC} = 4 MHz	0.8	2	

1. Data based on characterization results.
2. ADC accuracy vs. negative injection current: Injecting negative current on any of the analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in [Section 9.3.6](#) does not affect the ADC accuracy.

Figure 42. ADC accuracy characteristics

1. Example of an actual transfer curve.
 2. The ideal transfer curve
 3. End point correlation line
- E_T = Total unadjusted error: maximum deviation between the actual and the ideal transfer curves.
 E_O = Offset error: deviation between the first actual transition and the first ideal one.
 E_G = Gain error: deviation between the last ideal transition and the last actual one.
 E_D = Differential linearity error: maximum deviation between actual steps and the ideal one.
 E_L = Integral linearity error: maximum deviation between any actual transition and the end point correlation line.

Figure 43. Typical application with ADC

9.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during product characterization.

Functional EMS (electromagnetic susceptibility)

While executing a simple application (toggling 2 LEDs through I/O ports), the product is stressed by two electromagnetic events until a failure occurs (indicated by the LEDs).

- **ESD:** Electrostatic discharge (positive and negative) is applied on all pins of the device until a functional disturbance occurs. This test conforms with the IEC 61000-4-2 standard.
- **FTB:** A burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test conforms with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed. The test results are given in the table below based on the EMS levels and classes defined in application note AN1709.

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be recovered by applying a low state on the NRST pin or the oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Table 48. EMS data

Symbol	Parameter	Conditions	Level/class
V_{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = 25\text{ }^{\circ}\text{C}$, $f_{MASTER} = 16\text{ MHz}$, conforming to IEC 61000-4-2	2B ⁽¹⁾
V_{EFTB}	Fast transient voltage burst limits to be applied through 100pF on V_{DD} and V_{SS} pins to induce a functional disturbance	$V_{DD} = 3.3\text{ V}$, $T_A = 25\text{ }^{\circ}\text{C}$, $f_{MASTER} = 16\text{ MHz}$, conforming to IEC 61000-4-4	4A ⁽¹⁾

1. Data obtained with HSI clock configuration, after applying HW recommendations described in AN2860 - EMC guidelines for STM8Smicrocontrollers.

Electromagnetic interference (EMI)

Based on a simple application running on the product (toggling two LEDs through the I/O ports), the product is monitored in terms of emission. Emission tests conform to the IEC 61967-2 standard for test software, board layout and pin loading.

Table 49. EMI data

Symbol	Parameter	Conditions				Unit
		General conditions	Monitored frequency band	Max f _{HSE} /f _{CPU} ⁽¹⁾		
				16 MHz/ 8 MHz	16 MHz/ 16 MHz	
S _{EMI}	Peak level	V _{DD} = 5 V T _A = 25 °C LQFP32 package conforming to IEC 61967-2	0.1 MHz to 30 MHz	5	5	dBμV
			30 MHz to 130 MHz	4	5	
			130 MHz to 1 GHz	5	5	
	EMI level		-	2.5	2.5	-

1. Data based on characterization results.

Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, DLU and LU) using specific measurement methods, the product is stressed in order to determine its performance in terms of electrical sensitivity. For more details, refer to the application note AN1181.

Electrostatic discharge (ESD)

Electrostatic discharges (one positive then one negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts*(n+1) supply pin). One model can be simulated: the Human Body Model (HBM). This test conforms to the JESD22-A114A/A115A standard. For more details, refer to the application note AN1181.

Table 50. ESD absolute maximum ratings

Symbol	Ratings	Conditions	Class	Maximum value ⁽¹⁾	Unit
$V_{ESD(HBM)}$	Electrostatic discharge voltage (Human body model)	$T_A = 25\text{ °C}$, conforming to JESD22-A114	A	4000	V
$V_{ESD(CDM)}$	Electrostatic discharge voltage (Charge device model)	$T_A = 25\text{ °C}$, conforming to JESD22-C101	IV	1000	V

1. Data based on characterization results.

Static latch-up

Two complementary static tests are required on 10 parts to assess the latch-up performance:

- A supply overvoltage (applied to each power supply pin)
- A current injection (applied to each input, output and configurable I/O pin) is performed on each sample.

This test conforms to the EIA/JESD 78 IC latch-up standard. For more details, refer to the application note AN1181.

Table 51. Electrical sensitivities

Symbol	Parameter	Conditions	Class ⁽¹⁾
LU	Static latch-up class	T _A = 25 °C	A
		T _A = 85 °C	A

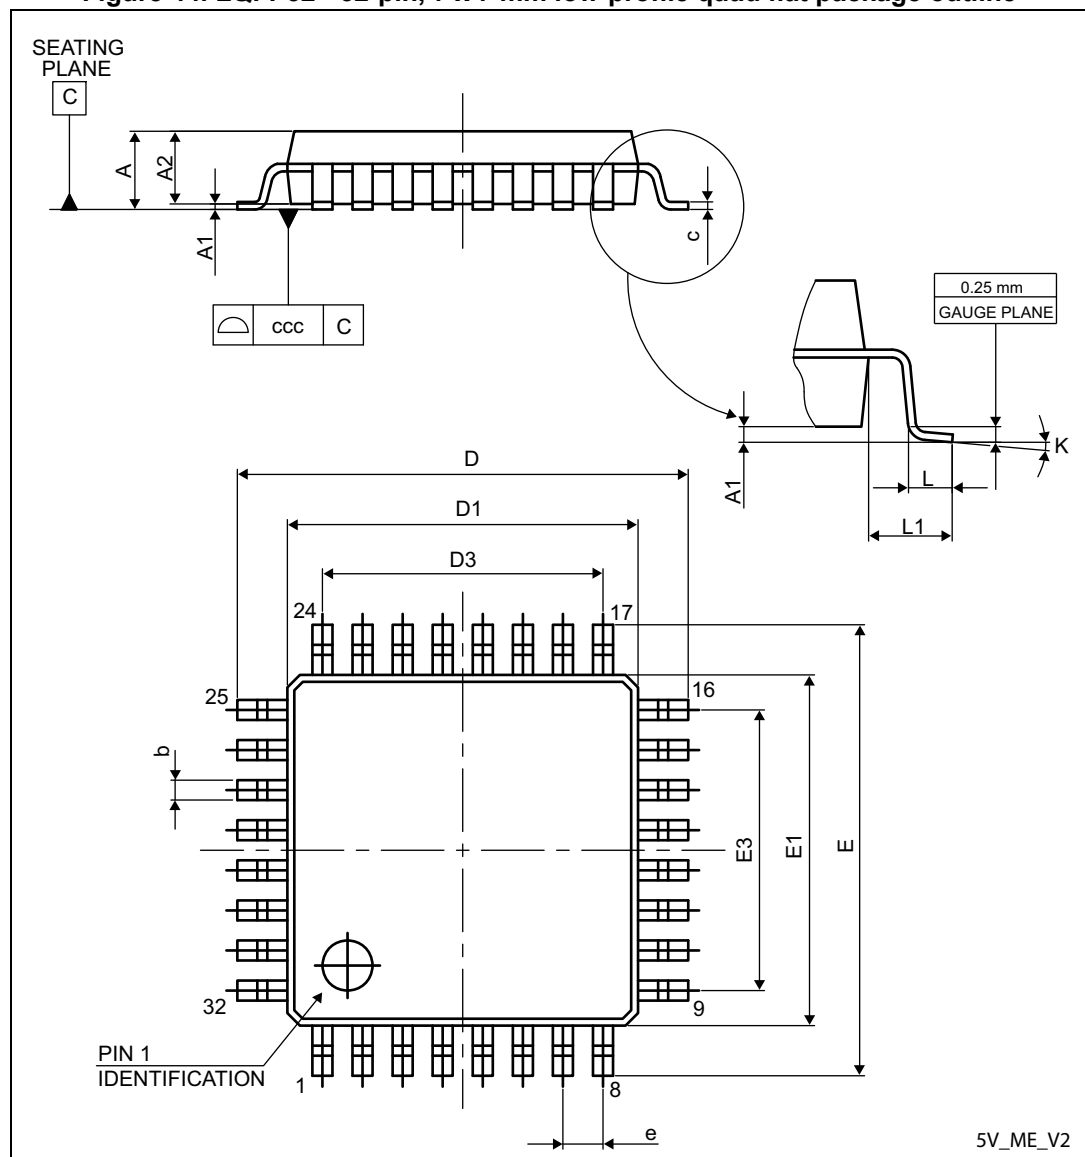

1. Class description: A Class is an STMicroelectronics internal specification. All its limits are higher than the JEDEC specifications, that means when a device belongs to class A it exceeds the JEDEC standard. B class strictly covers all the JEDEC criteria (international standard).

10 Package information

To meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at www.st.com. ECOPACK® is an ST trademark.

1. Values in inches are converted from mm and rounded to four decimal digits.
2. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15mm per side.
3. Dimension "E1" does not include interlead Flash or protrusions. Interlead Flash or protrusions shall not exceed 0.25mm per side.

Technical drawing of a 20-pin connector. The drawing shows two rows of pins, numbered 1 to 10 on the bottom and 11 to 20 on the top. The total width is 7.10. The distance between the centerlines of the two rows is 4.40. The pin pitch is 0.25. The distance between the centerline of pin 10 and the centerline of pin 11 is 0.65. The distance between the centerline of pin 5 and the centerline of pin 6 is 0.40. The pin height is 1.35. The drawing is a top view of the connector.

1. Dimensions are expressed in millimeters.

The following figure gives an example of topside marking orientation versus pin 1 identifier location. Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

The diagram illustrates the marking layout for the MS37768V1 component. It features a rectangular frame containing several elements:

- Standard ST logo:** A rectangular box in the top left corner.
- Product identification (1):** A rectangular box in the center containing the text "8S003F3P6".
- Pin 1 identifier:** A solid black circle in the bottom left corner.
- Date code:** A series of three rectangular boxes in the bottom right corner containing the characters "Y", "WW", and "R".
- Revision code:** A rectangular box in the top right corner.

Arrows point from the labels to their respective components in the diagram.

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering Samples to run qualification activity.

Figure 51. UFQFPN20 - 20-lead, 3 x 3 mm, 0.5 mm pitch, ultra thin fine pitch quad flat package recommended footprint

Device marking for UFQFPN20

The following figure gives an example of topside marking orientation versus pin 1 identifier location.

Other optional marking or inset/upset marks, which identify the parts throughout supply chain operations, are not indicated below.

Figure 52. UFQFPN20 marking example (package top view)

1. Parts marked as "ES", "E" or accompanied by an Engineering Sample notification letter, are not yet qualified and therefore not yet ready to be used in production and any consequences deriving from such usage will not be at ST charge. In no event, ST will be liable for any customer usage of these engineering samples in production. ST Quality has to be contacted prior to any decision to use these Engineering Samples to run qualification activity.

10.4 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 19: General operating conditions](#).

The maximum chip-junction temperature, T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$)
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.
- $P_{I/Omax}$ represents the maximum power dissipation on output pins, where:
 $P_{I/Omax} = \Sigma (V_{OL} \cdot I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \cdot I_{OH})$, and taking account of the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Table 55. Thermal characteristics⁽¹⁾

Symbol	Parameter	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient LQFP 32 - 7 x 7 mm	60	°C/W
	Thermal resistance junction-ambient TSSOP20 - 4.4 mm	84	
	Thermal resistance junction-ambient UFQFPN20 -3 x 3 mm	90	

1. Thermal resistances are based on JEDEC JESD51-2 with 4-layer PCB in a natural convection environment.

10.4.1 Reference document

JESD51-2 integrated circuits thermal test method environment conditions - natural convection (still air). Available from www.jedec.org.

10.4.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the order code (see [Figure 53: STM8S003F3/K3 value line ordering information scheme^{\(1\)}](#)).

The following example shows how to calculate the temperature range needed for a given application.

Assuming the following application conditions:

- Maximum ambient temperature $T_{Amax} = 75\text{ °C}$ (measured according to JESD51-2)
- $I_{DDmax} = 8\text{ mA}$, $V_{DD} = 5.0\text{ V}$
- Maximum 20 I/Os used at the same time in output at low level with
 $I_{OL} = 8\text{ mA}$, $V_{OL} = 0.4\text{ V}$
 $P_{INTmax} = 8\text{ mA} \times 5.0\text{ V} = 400\text{ mW}$
 $P_{Dmax} = 400\text{ mW} + 64\text{ mW}$
Thus: $P_{Dmax} = 464\text{ mW}$

Using the values obtained in [Section Table 55.: Thermal characteristics](#) T_{Jmax} is calculated as follows for LQFP32 7 x 7 mm = 60 °C/W:

$$T_{Jmax} = 75\text{ °C} + (60\text{ °C/W} \times 464\text{ mW}) = 75\text{ °C} + 27.8\text{ °C} = 102.8\text{ °C}$$

This is within the range of the suffix 6 version parts ($-40 < T_J < 105\text{ °C}$).

In this case, parts must be ordered at least with the temperature range suffix 6.

11 Ordering information

Figure 53. STM8S003F3/K3 value line ordering information scheme⁽¹⁾

Example:	STM8	S	003	K	3	T	6		TR
Product class	STM8 microcontroller								
Family type	S = standard								
Sub-family type⁽²⁾	00x = Value line sub-family 003 = low density								
Pin count	F = 20 pins K = 32 pins								
Program memory size	3 = 8 Kbyte								
Package type	T = LQFP P = TSSOP U = UFQFPN								
Temperature range	6 = -40 °C to 85 °C								
Package pitch	No character = 0.5 mm or 0.65 mm ⁽³⁾ C = 0.8 mm ⁽⁴⁾								
Packing	No character = Tray or tube TR = Tape and reel								

1. For a list of available options (e.g. memory size, package) and orderable part numbers or for further information on any aspect of this device, please go to www.st.com or contact the ST Sales Office nearest to you.
2. Refer to [Table 1: STM8S003F3/K3 value line features](#) for detailed description.

12 STM8 development tools

Development tools for the STM8 microcontrollers include the full-featured STice emulation system supported by a complete software tool package including C compiler, assembler and integrated development environment with high-level language debugger. In addition, the STM8 is to be supported by a complete range of tools including starter kits, evaluation boards and a low-cost in-circuit debugger/programmer.

12.1 Emulation and in-circuit debugging tools

The STice emulation system offers a complete range of emulation and in-circuit debugging features on a platform that is designed for versatility and cost-effectiveness. In addition, STM8 application development is supported by a low-cost in-circuit debugger/programmer.

The STice is the fourth generation of full featured emulators from STMicroelectronics. It offers new advanced debugging capabilities including profiling and coverage to help detect and eliminate bottlenecks in application execution and dead code when fine tuning an application.

In addition, STice offers in-circuit debugging and programming of STM8 microcontrollers via the STM8 single wire interface module (SWIM), which allows non-intrusive debugging of an application while it runs on the target microcontroller.

For improved cost effectiveness, STice is based on a modular design that allows users to order exactly what they need to meet their development requirements and to adapt their emulation system to support existing and future ST microcontrollers.

STice key features

- Occurrence and time profiling and code coverage (new features)
- Advanced breakpoints with up to 4 levels of conditions
- Data breakpoints
- Program and data trace recording up to 128 KB records
- Read/write on the fly of memory during emulation
- In-circuit debugging/programming via SWIM protocol
- 8-bit probe analyzer
- 1 input and 2 output triggers
- Power supply follower managing application voltages between 1.62 to 5.5 V
- Modularity that allows users to specify the components users need to meet their development requirements and adapt to future requirements
- Supported by free software tools that include integrated development environment (IDE), programming software interface and assembler for STM8.

12.2 Software tools

STM8 development tools are supported by a complete, free software package from STMicroelectronics that includes ST Visual Develop (STVD) IDE and the ST Visual Programmer (STVP) software interface. STVD provides seamless integration of the Cosmic and Raisonance C compilers for STM8. A free version that outputs up to 16 Kbytes of code is available.

12.2.1 STM8 toolset

STM8 toolset with STVD integrated development environment and STVP programming software is available for free download at www.st.com. This package includes:

ST Visual Develop – Full-featured integrated development environment from ST, featuring

- Seamless integration of C and ASM toolsets
- Full-featured debugger
- Project management
- Syntax highlighting editor
- Integrated programming interface
- Support of advanced emulation features for STice such as code profiling and coverage

ST Visual Programmer (STVP) – Easy-to-use, unlimited graphical interface allowing read, write and verify the user STM8 microcontroller Flash program memory, data EEPROM and option bytes. STVP also offers project mode for saving programming configurations and automating programming sequences.

12.2.2 C and assembly toolchains

Control of C and assembly toolchains is seamlessly integrated into the STVD integrated development environment, making it possible to configure and control the building of user application directly from an easy-to-use graphical interface.

Available toolchains include:

- **Cosmic C compiler for STM8** – One free version that outputs up to 16 Kbytes of code is available. For more information, see www.cosmic-software.com.
- **Raisonance C compiler for STM8** – One free version that outputs up to 16 Kbytes of code. For more information, see www.raisonance.com.
- **STM8 assembler linker** – Free assembly toolchain included in the STVD toolset, which allows users to assemble and link the user application source code.

12.3 Programming tools

During the development cycle, STice provides in-circuit programming of the STM8 Flash microcontroller on user application board via the SWIM protocol. Additional tools are to include a low-cost in-circuit programmer as well as ST socket boards, which provide dedicated programming platforms with sockets for programming the user STM8.

For production environments, programmers will include a complete range of gang and automated programming solutions from third-party tool developers already supplying programmers for the STM8 family.

13 Revision history

Table 56. Document revision history

Date	Revision	Changes
12-Jul-2011	1	Initial release.
09-Jan-2012	2	Added N_{RW} and t_{RET} for data EEPROM in <i>Table: Flash program memory and data EEPROM</i> . Updated R_{PU} in <i>Table: NRST pin characteristics</i> and <i>Table: I/O static characteristics</i> . Updated notes related to V_{CAP} in <i>Table: General operating conditions</i> .
12-Jun-2012	3	Updated temperature condition for factory calibrated ACC_{HSI} in <i>Table: HSI oscillator characteristics</i> . Changed SCK input to SCK output in <i>Figure: SPI timing diagram - master mode</i> . Modified <i>Figure: 20-lead, ultra thin, fine pitch quad flat no-lead package outline (3 x 3)</i> to add the package top view.
18-Dec-2014	4	Updated the package information for the 20-pin TSSOP and the 20-pin UFQFPN.
21-Apr-2015	5	Added package marking examples in <i>Section: Package information</i> : – <i>Figure: LQFP32 marking example (package top view)</i> , – <i>Figure: TSSOP20 marking example (package top view)</i> , – <i>Figure: UFQFPN20 marking example (package top view)</i> .
26-Jun-2015	6	Addition of the footnotes about D and E1 dimensions to <i>Table 53: TSSOP20 – 20-lead thin shrink small outline, 6.5 x 4.4 mm, 0.65 mm pitch, package mechanical data</i> . Update of the standard for EMI characteristics in <i>Section: Electromagnetic interference (EMI)</i> .
23-Sep-2015	7	Correction of UART peripheral in <i>Figure 1: STM8S003F3/K3 value line block diagram</i> .
20-Apr-2016	8	Corrected text strings in <i>Figure 10: External capacitor C_{EXT}</i> and <i>Figure 37: Recommended reset pin protection</i> . PB4 line PP column value corrected in <i>Table 5: STM8S003K3 descriptions</i> . PD1 line “floating” and “wpu” column values corrected in <i>Table 6: STM8S003F3 pin description</i> . SPI_RXCRCR and SPI_TXCRCR reset values corrected in <i>Table 9: General hardware register map</i> .
